

Tinnix, a Boston startup, has a novel treatment for tinnitus (a disease where the person hears virtual irritating sounds). We seek a person with digital processing skills to write a smart phone application to deliver customized music therapy. We guess that it will take four weeks to develop the first version and several more weeks to refine it. We then will run a clinical trial. If the trial validates our therapy then Tinnix will need a full time software engineer as we go to market. Your expertise in writing an audio application trumps credentials. So if this is of interest please email Norman@Priebatsch.com and tell us about your skills.
