- The assignment is due at Gradescope on Friday, February 3 at 11:59am. Late assignments will not be accepted. Submit early and often.
- You are permitted to study with friends and discuss the problems; however, *you must write up you own solutions, in your own words*. Do not submit anything you cannot explain. If you do collaborate with any of the other students on any problem, please do list all your collaborators in your submission for each problem.
- Finding solutions to homework problems on the web, or by asking students not enrolled in the class is strictly prohibited.
- We require that all homework submissions are prepared in Latex. If you need to draw any diagrams, however, you may draw them with your hand. Please use *a new page to begin each answer*.

PROBLEM 1 Why 5 in Median?

Recall the deterministic selection algorithm:

```
1: procedure SELECT(A[1, ..., n], i)
       k \leftarrow 5
 2:
       if n \leq 3k then
3:
            use brute force (sort and pluck)
 4:
        else
 5:
            m \leftarrow |n/k|
 6:
            for i \leftarrow 1 to m do
 7:
                M[i] \leftarrow \text{SELECT}(A[k \cdot (i-1) + 1, \dots, k \cdot i], [k/2]) \mapsto \text{Find medians among groups of size } k
 8:
            end for
 9:
            MoM \leftarrow \text{Select}(M[1...,m], [m/2])
                                                                                                                ▷ Recursion
10:
            ▷ Shuffle A[] so that MoM is at position r, A[1, ..., r-1] \le MoM and MoM \le A[r+1, ..., n]
11:
            r \leftarrow \text{Partition}(A[1, \dots, n], MoM)
12:
           if r = i then
13:
                return MoM
14:
            else if r < i then
15:
                return SELECT(A[r+1,\ldots,n], i-r)
                                                                                                                ▷ Recursion
16:
            else
17:
                return SELECT(A[1, \ldots, r-1], i)
                                                                                                                ▷ Recursion
18:
            end if
19:
        end if
20:
21: end procedure
```

(a) In class, we showed that with k = 5, the value of r returned by PARTITION(A[1, ..., n], MoM) is at least 3n/10 - 3/2 and at most 7n/10 + 5/2. Suppose that instead we use k = 3. State an upper and lower bound on the value of r returned by PARTITION(A[1, ..., n], MoM). Be as precise as you can.

Solution:

(b) Write a recurrence for S(n), the running time of SELECT(A[1,...,n],i), using the bounds on r you got for k = 3.

(c) Use induction to prove S(n) = Ω(n log n) for k = 3. Ignore all ceiling/floor for simplicity.
 Solution:

PROBLEM 2 Skyline

A great skyline must have variations. Define the left skyline function, denoted $n_{\ell}(s)$, of a skyline *s* as the total number of times that a building is taller than one of its left neighbors. The right skyline function, $n_r(\cdot)$, is defined analogously. The skyline *s* below has 4 buildings, and $n_{\ell}(s) = 3$ and $n_r(s) = 3$ because building 2 is taller than building 1 and building 4 is taller than buildings 3 and 1, and alternatively, building 1 is taller than 3, and building 2 is taller than 3 and 4.

As another example, this skyline has $n_{\ell} = 19$, the contribution of each building is listed below the building.

We will design and analyze a divide and conquer algorithm that computes the right and left skyline functions of a skyline *s* with *n* buildings. The input A[1, ..., n] consists of the heights of each building along a street in left to right order; assume all buildings have unique heights.

(a) The left skyline function is the sum of 3 terms: the score of the left half, the score of the right half, and the number of pairs of buildings, one on the left half and one on the right half such that the right one is taller than the left one. In divide and conquer algorithms, we can recursively compute the first two terms so we just need to focus on the third term. Describe how you can compute the third term in $O(n^2)$ time.

Solution:

(b) We need to compute the third term faster. First we sort the buildings on each half in *increasing* heights. Then we merge the two sorted lists into one as in mergesort. If a building *B* is ranked *u* in the sorted list of buildings in the right half and ranked *v* in the sorted list of all buildings, how many buildings are there in the left half that are shorter than *B*?

- (c) Design a function LEFTSKYLINE(A[1...n]) that returns the sorted list A' (A sorted in increasing heights) and the left skyline function of A. Hint: the algorithm can recursively compute the first two terms and the sorted halves and then use merging to compute the third term and the big sorted list. Your time for computing the third term should be O(n). Hint: you can use the following MergeSort pseudocode as starting point.
 - 1: **function** MergeSort(A[1...n])
 - 2: **if** n = 1 **then return** A

```
else
 3:
             m \leftarrow \lfloor n/2 \rfloor
 4:
             A1 \leftarrow \text{MergeSort}(A[1 \dots m])
 5:
             A2 \leftarrow \text{MergeSort}(A[m+1...n])
 6:
             A' \leftarrow ()
 7:
             i \leftarrow 1
 8:
             j \leftarrow 1
 9:
             while i \leq m and j \leq n - m do
10:
                 if A1[i] < A2[j] then
11:
                      Append A1[i] to A'
12:
                      i \leftarrow i + 1
13:
                 else
14:
                      Append A2[j] to A'
15:
                     j \leftarrow j + 1
16:
                 end if
17:
             end while
18:
             \triangleright A1[i \dots m] are larger than all elements in A2[]
19:
             Append A1[i \dots m] to A'
20:
             \triangleright A2[j \dots n - m] are larger than all elements in A1[]
21:
             Append A2[j \dots n - m] to A'
22:
             return A'
23:
         end if
24:
25: end function
```

Solution:

(d) Write a recurrence for the running time of your algorithm and solve it using the master theorem.

PROBLEM 3 Programming Skyline

In this part, you will implement your algorithm for Skyline and test it on real data. Register and take on the challenge at https://www.hackerrank.com/contests/cs4800-s17. Please put here your username and score.
