

Hello!

# CS3000: Algorithms & Data

## Jonathan Ullman

Lecture 16:

- Applications of Network Flow

March 23, 2020

# Midterm II

- **Logistics:**

- Wednesday April 1<sup>st</sup>
- Administrated through Gradescope
- Exam will be available from 2:50pm until \_\_\_\_\_
- You have 90 minutes from the time you start

- **Academic Honesty:**

- You will have to take an honor pledge
- Do not discuss the exam with **anyone** for 24 hours
- Please be a good citizen

# Midterm II

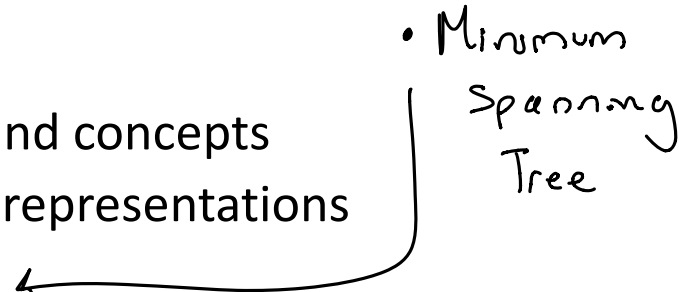

- **Format:**

- Same as Midterm I, but condensed for Gradescope

- **Topics (graph algos):**

- Key graph definitions and concepts
- Adjacency list / matrix representations
- DFS + topological sort
- Shortest paths: BFS, Dijkstra, Bellman-Ford
- Network flow: concepts, Ford-Fulkerson, choosing paths
- **Does not include this week**

• Minimum  
Spanning  
Tree

# Applications of Network Flow

If I have seen further than others, it is  
by standing upon the shoulders of giants.

*Isaac Newton*

*www.thequotes.in*

# Applications of Network Flow

- Algorithms for maximum flow can be used to solve:
  - Bipartite Matching
  - Disjoint Paths
  - Survey Design
  - Matrix Rounding
  - Auction Design
  - Fair Division
  - Project Selection
  - Baseball Elimination
  - Airline Scheduling
  - ...

If a problem can be solved in polynomial time, then it can be written as an application of max flow.

# Reduction

- **Definition:** a **reduction** is an efficient algorithm that solves **problem A** using calls to function that solves **problem B**.

# Mechanics of Reductions

- What exactly is a **problem**?

- A set of legal inputs  $X$  (e.g. a list of numbers  $A[1] \dots A[n]$ )

- A set  $A(x)$  of legal outputs for each  $x \in X$   
(e.g.  $A$  in sorted order)

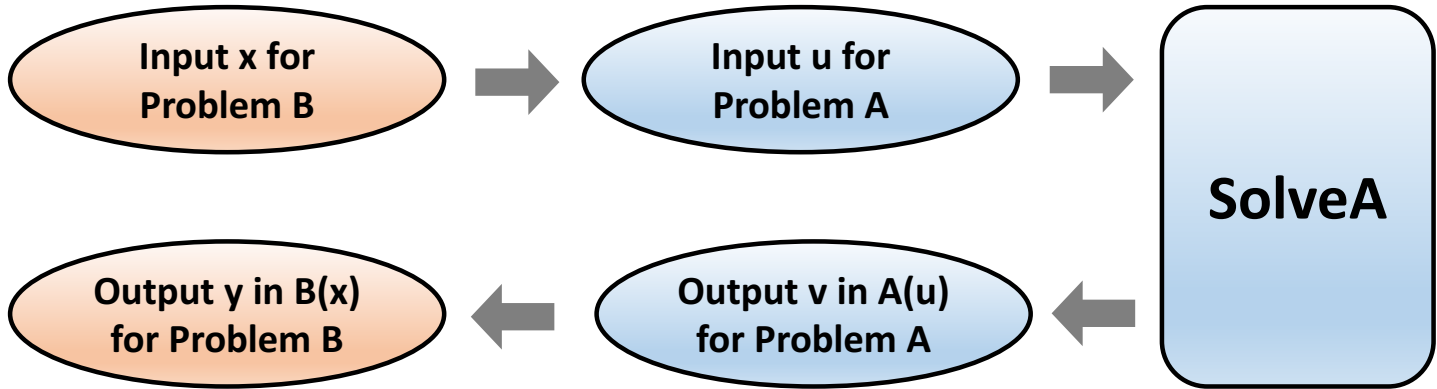

- **Example:** integer maximum flow

Inputs:  $G = (V, E, \{c(e)\}, s, t)$  where  
 $c(e)$  is an integer for every  $e \in E$ .

Outputs: A maximum flow  $\{f(e)\}$  for  $G$   
where  $f(e)$  is an integer for every  $e \in E$ .

# Mechanics of Reductions

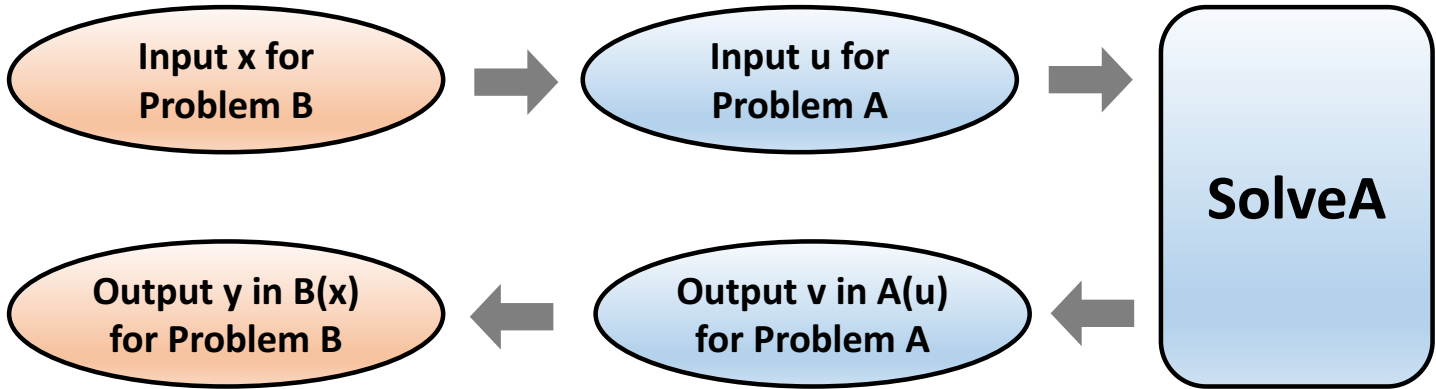

Use an alg for Problem A  
to solve Problem B

Simplified Version: we only make  
one call to SolveA

# When is a Reduction Correct?

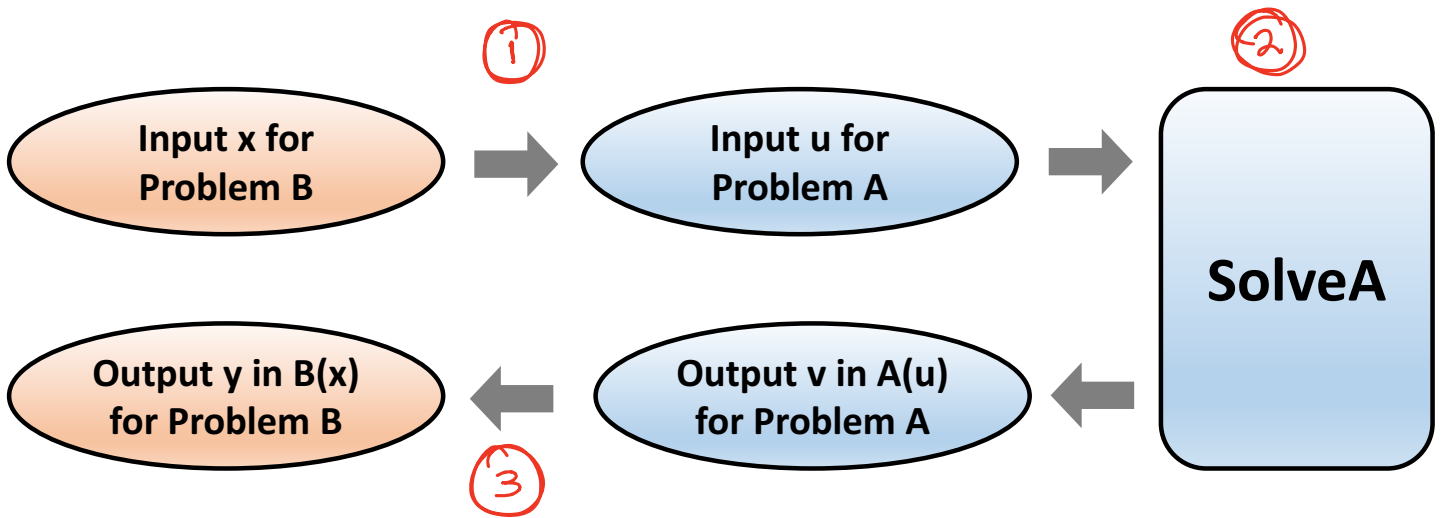

For every valid input  $x$ :

If  $v$  is any valid output in  $A(u)$ ,  
then  $y$  is a valid output in  $B(x)$

Assume for valid  
input  $u$  for ProbA,  
 $SolveA(u)$  returns  
a valid output  $v \in A(u)$

↑  
Can be any  $v \in A(u)$

# What is the Running Time?

$$\text{Total Time} = \hat{1} + \hat{2} + \hat{3}$$

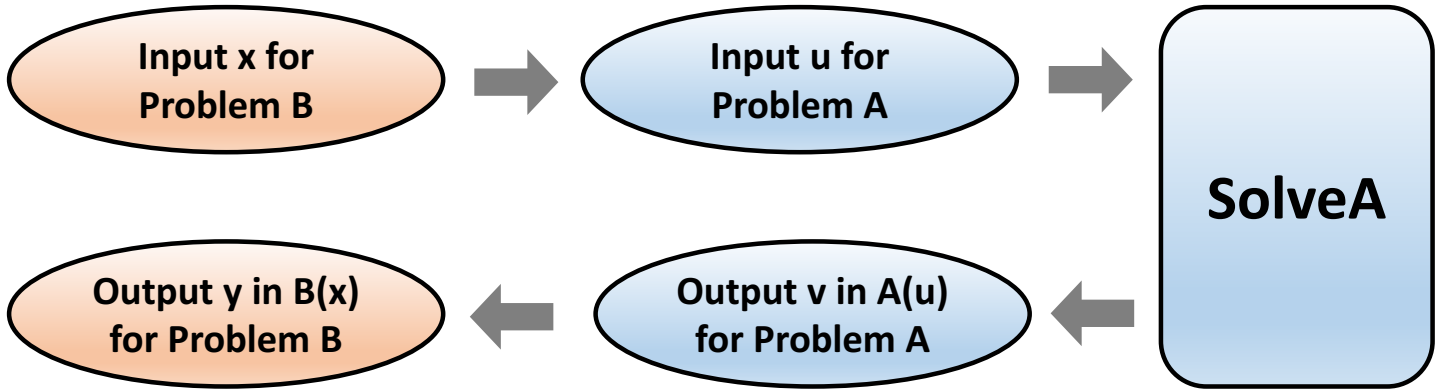

$\hat{2}$  depends on the running time of Solve A  
on the input  $u$ .

(The size of  $u$  may differ from that of  $x$ )

# Example: Minimum Cut

$A = \text{max flow}$

$B = \text{min cut}$

Input  $x$  for  $B$ :  $G = (V, E, \{c(e)\}, s, t)$

↓

Input  $u$  for  $A$ :  $G = (V, E, \{c(e)\}, s, t)$

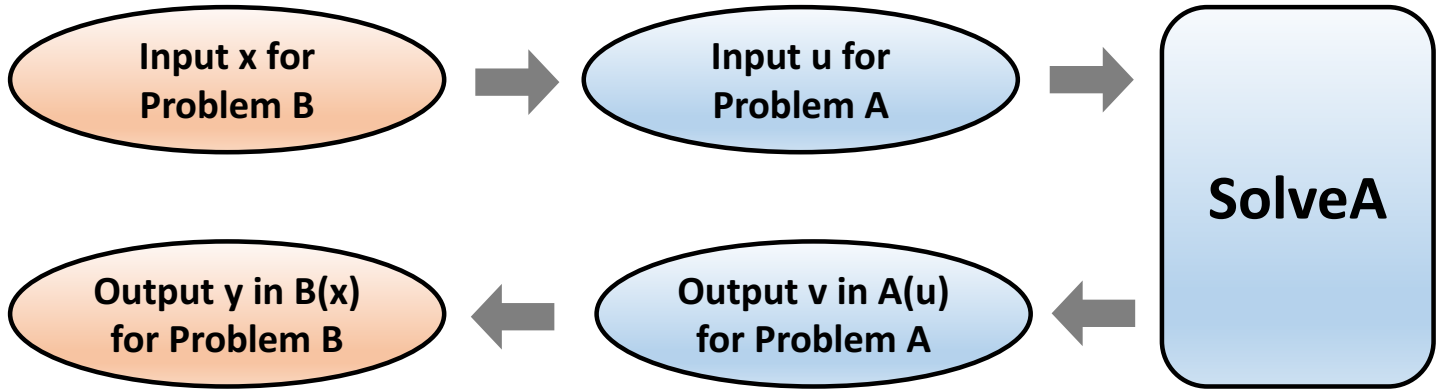

↓

Output  $v \in A(u)$ : A max flow  $f$  in  $G$

# Example: Minimum Cut

$A = \text{max flow}$

$B = \text{min cut}$

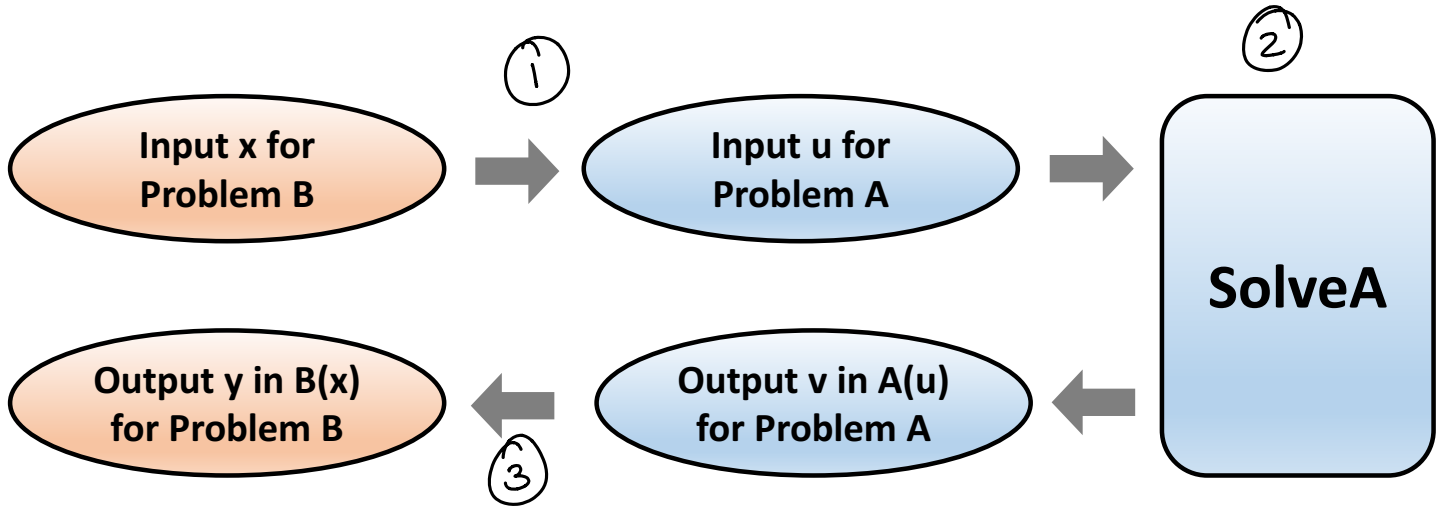

↓

- Output  $y \in B(x)$  :
- ① Take  $f$ , compute residual graph  $G_f$
  - ② Find nodes reachable from  $s$  in  $G_f$
  - ③ Output those nodes as the cut.

# Example: Minimum Cut

A = max flow

B = min cut

Running Time:

① Do nothing

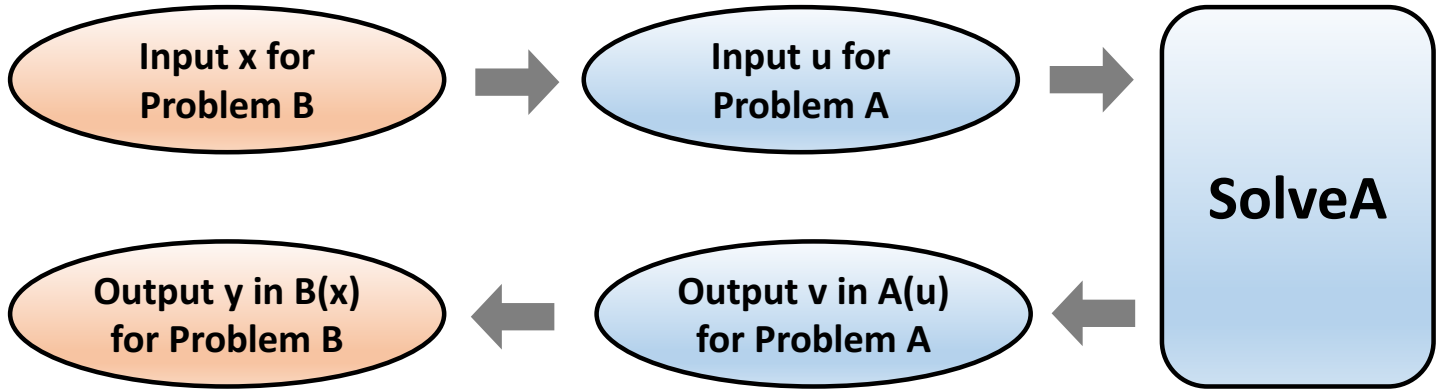

②  $O((\text{nodes } m \cdot u) (\text{edges } m \cdot u)) = O(nm)$

③ BFS,  $O(n \cdot m)$  time

solve max flow  
in  $O(nm)$  time

# Example: Median

A = sorting  
B = median

Input  $x$  for B: An array  $A$  of length  $n$

Input  $u$  for A: The same array

Output  $v \in A(u)$ :  $A$  in sorted order

Output  $y \in B(x)$ :  $A[\lfloor \frac{n}{2} \rfloor]$

$O(n \log n)$

# Bipartite Matching

$$\forall e = (u, v) \in E$$

$u \in L, v \in R$  or vice versa

- **Input:** bipartite graph  $G = (V, E)$  with  $V = L \cup R$
- **Output:** a maximum cardinality matching
  - A **matching**  $M \subseteq E$  is a set of edges such that every node  $v$  is an endpoint of at most one edge in  $M$
  - Cardinality =  $|M|$

Models any problem where one type of object is assigned to another type:

- doctors to hospitals
- jobs to processors
- advertisements to websites

red edges are a matching

# Bipartite Matching

MBM = max bipartite matching  
IMF = integer max flow

- There is a reduction that uses integer maximum s-t flow to solve maximum bipartite matching.

# Step 1: Transform the Input

A matching gives a set of non-overlapping pipes from L to R

Set all capacities to  $c(e) = 1$

# Step 1: Transform the Input

# Step 2: Receive the Output

Matching will be all of the  $L \rightarrow R$  edges that carry flow

Red arrow means  $f(e) = 1$   
Black means  $f(e) = 0$

# Step 3: Transform the Output

Output M for MCBM

Output f for MAXFLOW

$M = \text{all edges from } L \text{ to } R \text{ that carry flow}$

# Reduction Recap

- **Step 1: Transform the Input**

- Given  $G = (L,R,E)$ , produce  $G' = (V,E,\{c(e)\},s,t)$  by...
  - ... orienting edges  $e$  from  $L$  to  $R$
  - ... adding a node  $s$  with edges from  $s$  to every node in  $L$
  - ... adding a node  $t$  with edges from every node in  $R$  to  $t$
  - ... setting all capacities to 1

- **Step 2: Receive the Output**

- Find an integer maximum  $s$ - $t$  flow  $f$  in  $G'$

- **Step 3: Transform the Output**

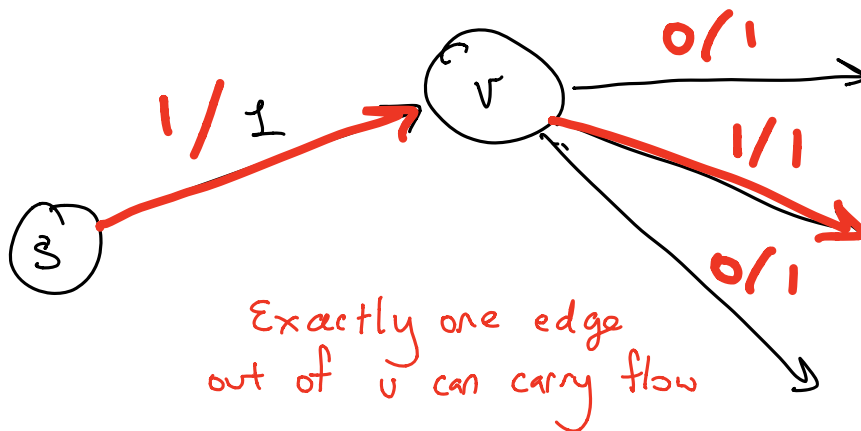

- Given an integer  $s$ - $t$  flow  $f(e)$ ...
  - Let  $M$  be the set of edges  $e$  going from  $L$  to  $R$  that have  $f(e)=1$

# Correctness

- Need to show:

- (1) This algorithm returns a matching
- (2) This matching is a maximum cardinality matching

① Matching: Every node  $v$  is the endpoint of at most 1 edge in  $M$ .

# Correctness

- Need to show:
  - (1) This algorithm returns a matching
  - (2) This matching is a maximum cardinality matching

# Correctness

- This algorithm returns a matching

# Correctness

- **Claim:**  $G$  has a matching of cardinality at least  $k$  if and only if  $G'$  has an  $s$ - $t$  flow of value at least  $k$

A matching of size  $k$  gives a flow of value  $k$

# Correctness

- **Claim:**  $G$  has a matching of cardinality at least  $k$  if and only if  $G'$  has an  $s$ - $t$  flow of value at least  $k$

A flow of value  $k$  must have  $k$  edges carrying flow from  $L$  to  $R$

$G$  has  $n$  nodes,  $m$  edges

# Running Time

- Need to analyze the time for:

- (1) Producing  $G'$  given  $G$
- (2) Finding a maximum flow in  $G'$
- (3) Producing  $M$  given  $G'$

$O(nm)$

- ①  $G'$  has  $n+2$  nodes,  $n+m$  edges  
Can write  $G'$  in time  $O(n+m)$
- ②  $T(n+2, n+m)$  where  $T(n', m')$  is the  
time to solve max flow in a graph with  $n'$   
nodes  $m'$  edges :  $O(nm)$
- ③ Scan the edges of  $G'$  and see which have flow  
 $O(n+m)$  time

# Summary

Solving maximum <sup>Integer</sup> s-t flow in a graph with  $n+2$  nodes and  $m+n$  edges and  $c(e) = 1$  in time  $T$

Solving maximum bipartite matching in a graph with  $n$  nodes and  $m$  edges in time  $T + O(m+n)$

- Can solve max bipartite matching in time  $O(nm)$  using Ford-Fulkerson
  - Improvement for maximum flow gives improvement for maximum bipartite matching

# Hall's Theorem:

$G$  has a perfect matching iff there does not exist a

set of nodes  $S \subseteq L$

such that  $|\Gamma(S)| \leq |S|$

$\Gamma(S)$  is the set of all neighbors of nodes in  $S$

every nodes gets matched

obstacle
