

# CS3000: Algorithms & Data

## Jonathan Ullman

### Lecture 21:

- Stable Matching: the Gale-Shapley Algorithm

Apr 13, 2020

# National Residency Matching Program

- National system for matching US medical school graduates to medical residencies
  - Roughly 40,000 doctors per year
  - Assignment is almost entirely algorithmic

David Gale (1921-2008)  
PROFESSOR, UC BERKELEY

Lloyd Shapley  
PROFESSOR EMERITUS, UCLA

Alvin Roth  
PROFESSOR, STANFORD

# Labor Markets

- Most labor markets are frustrating
  - Not everyone can get their favorite job
  - The market is **decentralized**
- Decentralized labor markets are frustrating

# Centralized Labor Markets

- What if we could just assign jobs?
  - What information would we want?
  - How would we choose the assignment?

# Matchings

- We are given the following information
  - $n$  doctors  $d_1 \dots d_n$
  - $n$  hospitals  $h_1 \dots h_n$
  - each doctor's ranking of hospitals  $d_1 : h_2 > h_3 > h_1$
  - each hospital's ranking of doctors  $h_1 : d_1 > d_3 > d_2$

# Matchings

- A **matching**  $M$  is a set of doctor-hospital pairs
  - $M = \{ (d_1, h_2), (d_2, h_3), \dots \}$
  - **matching**: no doctor/hospital appears twice
  - **perfect matching**: every doctor/hospital appears once
  - “ $d$  is matched to  $h$ ”:  $(d, h) \in M$

# Stable Matchings

- A matching  $M$  is **unstable** if some doctor-hospital pair prefer one another to their mate in  $M$
- **Instabilities**
  - $d, h$  such that  $d$  is matched to  $h'$ ,  $h$  is unmatched, but  $d : h \succ h'$

# Stable Matchings

- A matching  $M$  is **unstable** if some doctor-hospital pair prefer one another to their mate in  $M$
- **Instabilities**
  - $d, h$  such that  $h$  is matched to  $d'$ ,  $d$  is unmatched, but  $h : d \succ d'$

# Stable Matchings

- A matching  $M$  is **unstable** if some doctor-hospital pair prefer one another to their mate in  $M$
- **Instabilities**
  - $d, h$  such that  $d$  is matched to  $h'$ ,  $h$  is matched to  $d'$ , but  $d : h \succ h'$  and  $h : d \succ d'$

# Ask the Audience

- Either find a stable matching or convince yourself that there is no stable matching

# Gale-Shapley Algorithm

- Let  $M$  be empty
- While (some hospital  $h$  is unmatched):
  - If ( $h$  has offered a job to everyone): break
  - Else: let  $d$  be the highest-ranked doctor to which  $h$  has not yet offered a job
  - Have  $h$  make an offer to  $d$ :
    - If ( $d$  is unmatched):
      - $d$  accepts, add  $(d,h)$  to  $M$
    - ElseIf ( $d$  is matched to  $h'$  &  $d: h' > h$ ):
      - $d$  rejects, do nothing
    - ElseIf ( $d$  is matched to  $h'$  &  $d: h > h'$ ):
      - $d$  accepts, remove  $(d,h')$  from  $M$  and add  $(d,h)$  to  $M$
- Output  $M$

# Gale-Shapley Demo

Clara	BW	BID	MTA	CH	MGH
Dorit	MGH	CH	MTA	BID	BW
Ernie	MTA	BW	CH	BID	MGH

# Observations

- Hospitals make offers in descending order
- Doctors that get a job never become unemployed
- Doctors accept offers in ascending order

# Gale-Shapley Algorithm

- Questions about the Gale-Shapley Algorithm:
  - Will this algorithm terminate?
  - Does it output a perfect matching?
  - Does it output a stable matching?
  - How do we implement this algorithm efficiently?

# GS Algorithm: Termination

- **Claim:** The GS algorithm terminates after  $n^2$  iterations of the main loop (offers)

# GS Algorithm: Perfect Matching

- **Claim:** The GS algorithm returns a perfect matching (all doctors/hospitals are matched)

# GS Algorithm: Stable Matching

- **Stability:** GS algorithm outputs a stable matching
- Proof by contradiction:
  - Suppose there is an instability  $d, d', h, h'$

# GS Algorithm: Running Time

- **Running Time:**

- A straightforward implementation is  $O(n^3)$  time

# GS Algorithm: Running Time

- Let  $M$  be empty
- While (some hospital  $h$  is unmatched):
  - If ( $h$  has offered a job to everyone): break
  - Else: let  $d$  be the highest-ranked doctor to which  $h$  has not yet offered a job
  - $h$  makes an offer to  $d$ :
    - If ( $d$  is unmatched):
      - $d$  accepts, add  $(d,h)$  to  $M$
    - ElseIf ( $d$  is matched to  $h'$  &  $d: h' > h$ ):
      - $d$  rejects, do nothing
    - ElseIf ( $d$  is matched to  $h'$  &  $d: h > h'$ ):
      - $d$  accepts, remove  $(d,h')$  from  $M$  and add  $(d,h)$  to  $M$
- Output  $M$

# GS Algorithm: Running Time

- **Running Time:**

- A careful implementation requires is  $O(n^2)$  time

# GS Algorithm: Running Time

- **Running Time:**

- A careful implementation requires is  $O(n^2)$  time

# Real World Impact

TABLE I  
STABLE AND UNSTABLE (CENTRALIZED) MECHANISMS

Market	Stable	Still in use (halted unraveling)
<b>American medical markets</b>		
NRMP	yes	yes (new design in '98)
Medical Specialties	yes	yes (about 30 markets)
<b>British Regional Medical Markets</b>		
Edinburgh ('69)	yes	yes
Cardiff	yes	yes
Birmingham	no	no
Edinburgh ('67)	no	no
Newcastle	no	no
Sheffield	no	no
Cambridge	no	yes
London Hospital	no	yes
<b>Other healthcare markets</b>		
Dental Residencies	yes	yes
Osteopaths (<'94)	no	no
Osteopaths ( $\geq$ '94)	yes	yes
Pharmacists	yes	yes
<b>Other markets and matching processes</b>		
Canadian Lawyers	yes	yes (except in British Columbia since 1996)
Sororities	yes (at equilibrium)	yes

Table 1. Reproduced from Roth (2002, Table 1).

# Real World Impact

- **Doctors ↔ Hospitals**
  - Have to deal with two-body problems
  - Have to make sure doctors do not game the system
- **Kidneys ↔ Patients**
  - Not all matches are feasible (blood types)
  - Certain pairs must be matched
- **Students ↔ Public Schools**
  - Siblings, walking zones, diversity
- **Reform Rabbis ↔ Synagogues**
  - No idea, just a fun example

# Course Wrapup

- What did we study?
  - A toolkit for solving challenging computational problems
  - A way of thinking about computational problems
  - A way of talking about computational problems
  - How to ace your interviews

# Course Wrapup

- **What we didn't study?**

- Algorithms has become a more unified, and highly mathematically sophisticated field
- Many kinds of algorithms and applications
  - Randomized algorithms
  - Linear and convex optimization
  - Numerical algorithms
  - Algorithms for number theory
  - Machine learning algorithms
  - Algorithms for strategic agents
  - Fairness, privacy, ethics in algorithms
  - Algorithms for quantum computers
  - Distributed / parallel algorithms
  - Naturally occurring algorithms

**I hope you'll  
choose to learn  
about (some of)  
these topics!**
