Super-resolution for MAX-SAT

November 20, 2006

We use $N$ to keep track of the best assignment so far. $N$ is a complete assignment, and is assigned arbitrarily at the beginning.

1. Unit-Propagation:

   \[ M||F, C + k||N \Rightarrow Mk||F, C + k||N \]

   if $C + k$ is a super-resolvent, and

   $M \vdash \neg C$, and

   $k$ is undefined in $M$.

   or if $C + k$ is not a super-resolvent, and

   $M \vdash \neg C$, and

   $k$ is undefined in $M$, and

   \[ \text{unsat}(M\neg k; F, C + k) \geq \text{unsat}(N; F, C + k). \]

2. Semi-Super-resolution:

   \[ I||F||N \Rightarrow I||F,(\text{the disjunction of the negated decision literals in } I)||N \]

   if $R = \text{Contradiction}(I, F) \neq \emptyset$, and

   \[ \text{unsat}(IR; F) \geq \text{unsat}(N; F). \]

Informal: Intuitively, since $R$ is driven by $I$ through unit-propagation, thus, the fact that "\text{unsat}(IR; F) \geq \text{unsat}(N; F)" implies that we have made a mistake by setting the partial interpretation to $I$, which is the reason why we add the negated decision literals in $I$ to $F$ so that we won’t make the same mistake again.

\textit{Contradiction}(I, F): there has been a sequence of transitions from the state $I||F||N$ by Unit-Propagation to a state $IR||F||N$ at this point where some clause(s) is unsatisfied by $(IR)$. Contradiction returns $R$ if there is a contradiction and $\emptyset$ otherwise.
3. Decide:

\[ M \| F \| N \Rightarrow M k^* \| F \| N \]

if \( k \) is undefined in \( M \), and
\( k \) and \( \neg k \) occur in some clause(s) of \( F \).

4. Finale:

\[ M \| F \| N \Rightarrow M \| F \| N \]

if \( \text{unsat}(M; F) = \text{unsat}(N; F) \), \( M \) is complete and contains no decision literals, or
if \( F \) contains an empty super-resolvent, or
if \( \text{unsat}(M; F) = 0 \) and \( M \) is complete.

5. Restart:

\[ M \| F \| N \Rightarrow \emptyset \| F \| N \]

6. Update:

\[ M \| F \| N \Rightarrow M \| F \| M \]

if \( M \) is complete, and
\( \text{unsat}(M; F) < \text{unsat}(N; F) \).

7. Subsumption:

\[ M \| F, SR_1, SR_2 \| N \Rightarrow M \| F, SR_2 \| N \]

if \( SR_1 \) and \( SR_2 \) are super-resolvents, and
\( SR_2 \) is a subset of \( SR_1 \).

**Transition Sequence**

(UPD (SSR | Update) [Finale] Restart)*
