CS 6120/CS 4120: Natural Language Processing
Instructor: Prof. Lu Wang
College of Computer and Information Science
Northeastern University
Webpage: www.ccs.neu.edu/home/luwang

Time and Location
• Time: Tuesdays and Fridays, 9:50 am - 11:30 am
• Location: West Village H 110

Course Webpage
• http://www.ccs.neu.edu/home/luwang/courses/cs6120_sp2019/cs6120_sp2019.html
• You can also go to the instructor’s web page and find it from there:
  • http://www.ccs.neu.edu/home/luwang/

Prerequisites
• Programming
  • Being able to write code in some programming languages (e.g. Python, Java, C/C++, Matlab) proficiently
• Courses
  • Algorithms (official prerequisite)
  • Some calculus
  • Probability and statistics
  • Linear algebra (optional but highly recommended)
  • Supervised machine learning (also optional but highly recommended, newly added)

Prerequisites (next lecture):
• Quiz 0 (next lecture):
  • 20 simple questions, True or False (relevant to probability, statistics, and linear algebra)
  • The purpose of this quiz is to indicate the expected background of students.
  • 80% of the questions should be easy to answer.
  • If you didn’t take algorithm yet, you’ll need to get 80% to request for enrollment.
  • Not counted in your final score!

Textbook and References
• Main textbook
  • We will use some material from 3rd edition when it is available.
    • http://www.statsoftinc.com/textbook/
• Other reference
  • Chris Manning and Hinrich Schutze, "Foundations of Statistical Natural Language Processing", MIT Press, 1999
• Machine learning textbooks:
Topics of the Course (tentatively)

- Language Modeling
- Part-of-Speech Tagging
- Text Categorization: Word sense disambiguation, named entity recognition
- Syntax: Formal Grammar of English, Syntactic Parsing, Statistical Parsing, Dependency Parsing
- Semantics: Vector Space, Lexical Semantics, Semantics with tensor method
- Information Extraction
- Question Answering
- Machine Translation
- Summarization
- Sentiment Analysis, Opinion Mining
- NLP and Social Media
- Dialog Systems and Chatbots

The Goal

- Study fundamental tasks in NLP
- Learn some classic and state-of-the-art techniques
- Acquire hands-on skills for solving NLP problems
- Even some research experience!

Grading

- Assignment (30%)
  - 2 assignments, 15% for each
  - Both will be out early in the semester
- Quiz (5%)
  - 8 in-class tests, 1% for each (three lowest scores are dropped), no make-up
- Final Exam (35%)
- Project (25%)
- Participation (5%)
  - Classes: ask and answer questions, participate in discussions...
  - Piazza: help your peers, address questions...

Final Exam

- Open book
- Time and location: TBD (possibly April 16, same time and location as lectures)
- Do not make travel plans during exam weeks before the information is finalized.

Course Project

- An NLP-related project
- 2-3 students as a team

Course Project Grading

- The problem needs to be well-defined, useful, and practical.
  - Reasonable results and observations.
  - We encourage you to tackle a research-driven problem.
    - Something novel
    - A new problem
    - New methods that potentially lead to better performance
Sample Projects from Previous Offering

- Some examples from current course website:
  - Neural Semantic Parsing: Natural Language into SQL
  - Short Passages Reading Comprehension and Question Answering
  - Political Promise Evaluation (PPE)
  - Predicting Hemophilia Traits using Twitter
  - DEER-NLP: A TEXT MINING VISUALIZATION TOOL
  - Android Application for Visual QA
  - Novel summarizer and keyword identifier using TextRank with Sentence Form Detection
  - Periphrase Generation
  - Making sentence-level and macro Tweet Text
  - Machine Comprehension Using Match-LSTM and Answer-Pointer
  - Online Abuse Detection
  - Plagiarism Detection Using FP-Growth Algorithm
  - An examination of influential framing of controversial topics on Twitter

Neural Semantic Parsing: Natural Language into SQL

- Enterprise stores data in structured format
- Skilled workforce required to extract knowledge
- What if anyone could ask questions in natural language from structured text?

</table>

An example in WikiSQL. The inputs consist of a table and a question. The outputs consist of a ground-truth SQL query and the corresponding result from execution.

Short Passages Reading Comprehension and Question Answering

**Answer a simple question by reading a short passage.**

- Simple question: Factoid QA, < 30 words.
- Short passage: < 300 words.
- The answer is directly given as a range of the passage.

⇒ **INPUT:** A passage, a question.
⇒ **OUTPUT:** A range of the passage.

Jargon Detection and Explanation

- Making content accessible to common audience
- Find Jargon
- Define Jargon
- Insert definition into text

Detection and Interpretation of English Puns

- Puns are a class of language constructs, in which lexical-semantic ambiguity is a deliberate effect of the communication act.
- For example, "I used to be a banker but I lost interest."
More Project Samples

• Stanford NLP class
  • [http://web.stanford.edu/class/cs224n](http://web.stanford.edu/class/cs224n)
  • Notice its focus on deep learning
  • Your project can use any machine learning techniques, and shouldn’t be limited to deep learning only

Course Project Grading

• You are encouraged to talk to the instructor and/or TAs on project topics!
• How to find teammates?
  • Talk to your classmates and see if you share interests!
  • Post on piazza with your background (programming language and skills) and potential project ideas

Course Project Grading

• Three reports
  • Proposal (3%), due on Feb 6 at 11:59pm.
  • Progress, with code (7%)
  • Final, with code (10%)
• One presentation
  • In class (5%)

Audience Award

• Bonus points!
  • All teams vote for their favorite project(s) per session.
  • The team gets the most votes will be awarded with 1% bonus point!

Submission and Late Policy

• Programming language
  • Python (encouraged), Java, C/C++
• All submissions are in electronic format.
  • Due on blackboard.

Submission and Late Policy

• Assignment or report turned in late will be charged 20 points (out of 100 points) off for each late day (i.e. 24 hours).
• Each student has a budget of 5 days in total throughout the semester before a late penalty is applied.
• Late days are not applicable to final presentation.
• Each group member is charged with the same number of late days, if any, for their submission.
• You will only see the original grades on blackboard.
How to find us?

• All materials, including slides, assignments, sample reports, etc, can be found on the course webpage:

• Office hours
  • Prof. Ju Wang: Fridays, from 3pm to 4pm, or by appointment, Rm 911 at 177 Huntington Ave.
  • Note: to attend OH at 177, you’ll need to
    • Put down your name on Piazza by 2pm that Friday (Because I need to enter your name in the guest system!)‘
    • Bring your photo ID and check in at the front desk when you come in
  • TA Nil pref Badugu, Wednesdays 3:30pm-4:30pm, 132H Nightingale
  • TA Parweet Singh Saluja, Thursdays 5pm-6pm, 132H Nightingale
  • All OH starts in the week of January 14.

• Piazza
  • http://piazza.com/northeastern/spring2019/cs6120
  • All course relevant questions should go here! Also is the best way to reach the instructor and TAs.

What is Natural Language Processing?

• Allowing machines to communicate with human
  • Natural language understanding + natural language generation

What does it mean to understand a language?

Phonology
Morphology
Lexemes
Syntax
Semantics
Pragmatics
Discourse

What does it mean to understand a language?

Sound waves
Words
Parse trees
Meanings

Syntax, Semantic, Pragmatics

• Syntax concerns the proper ordering of words and its affect on meaning.
  • The dog bit the boy.
  • The boy bit the dog.
  • Bit boy dog the.
• Semantics concerns the (literal) meaning of words, phrases, and sentences.
  • “plant” as a photosynthetic organism
  • “plant” as the act of sowing
• Pragmatics concerns the overall communicative and social context and its affect on interpretation.
  • The ham sandwich wants another beer.
  • John thinks vanilla.

[Modified from Ray Mooney’s Slides]
Ambiguity is Ubiquitous

- Speech Recognition
  - "recognize speech" vs. "smack a nice beach"
  - "youth in Asia" vs. "euthanasia"

- Syntactic Analysis
  - "I ate spaghetti with chopsticks" vs. "I ate spaghetti with meatballs."

- Semantic Analysis
  - "The dog is in the pen." vs. "The ink is in the pen."
  - "I put the plant in the window" vs. "Ford put the plant in Mexico"

- Pragmatic Analysis
  - From "The Pink Panther Strikes Again":
    - Clouseau: Does your dog bite?
    - Hotel Clerk: No.
    - Clouseau: [bowing down to pet the dog]
      Nice doggie.
    - [Dog barks and bites Clouseau in the hand]
    - Clouseau: I thought you said your dog did not bite!
    - Hotel Clerk: That is not my dog.

Ambiguity is Explosive

- Ambiguities compound to generate enormous numbers of possible interpretations.
- In English, a sentence ending in \( n \) prepositional phrases has over \( 2^n \) syntactic interpretations:
  - "I saw the man with the telescope": 2 parses
  - "I saw the man on the hill with the telescope": 5 parses
  - "I saw the man on the hill in Texas with the telescope": 34 parses
  - "I saw the man on the hill in Texas with the telescope at noon": 42 parses
  - "I saw the man on the hill in Texas with the telescope at noon on Monday": 132 parses

Humor and Ambiguity

- Many jokes rely on the ambiguity of language:
  - Policeman to little boy: "We are looking for a thief with a bicycle." Little boy: "Wouldn’t you be better using your eyes."
  - Why is the teacher wearing sunglasses? Because the class is so bright.
  - Groucho Marx: One morning I shot an elephant in my pajamas. How he got into my pajamas, I’ll never know.
  - She criticized my apartment, so I knocked her flat.
  - Noah took all of the animals on the ark in pairs. Except the worms, they came in apples.
Why is Language Ambiguous?

• Having a unique linguistic expression for every possible conceptualization that could be conveyed would make language overly complex and linguistic expressions unnecessarily long.
• Allowing resolvable ambiguity permits shorter linguistic expressions, i.e. data compression.
• Language relies on people’s ability to use their knowledge and inference abilities to properly resolve ambiguities.
• Infrequently, disambiguation fails, i.e. the compression is lossy.

Some NLP Tasks

Word Segmentation

• Breaking a string of characters into a sequence of words.
• In some written languages (e.g. Chinese) words are not separated by spaces.
• Even in English, characters other than white-space can be used to separate words [e.g., ., ]
• Examples from English URLs:
 .jumptheshrink.com ⇒ jump the shark .com
 .twitter.com/realdonaldtrump ⇒ real donald trump .com
 .myspace.com/pluckerswingbar ⇒ myspace .com plucker swing bar

Morphological Analysis

• Morphology is the field of linguistics that studies the internal structure of words.
• A morpheme is the smallest linguistic unit that has semantic meaning (Wikipedia)
  • e.g. “carry”, “pre”, “ed”, “ly”, “s”
• Morphological analysis is the task of segmenting a word into its morphemes:
  • carried ⇒ carry + ed (past tense)
  • independently ⇒ in + [depend + end] + ly
  • Googlers ⇒ [Google + er] + s (plural)
  • unlockable ⇒ un + [lock + able] ?
    ⇒ [un + lock] + able ?
Part Of Speech (POS) Tagging

- Annotate each word in a sentence with a part-of-speech.
  I ate the spaghetti with meatballs.
  Pro V Det N Prep N
  John saw the saw and decided to take it to the table.
  PN V Det N Con V Part V Pro Prep Det N
- Usefull for subsequent syntactic parsing and word sense disambiguation.

Phrase Chunking

- Find all non-recursive noun phrases (NPs) and verb phrases (VPs) in a sentence.
  - [NP | [VP ate] [NP the spaghetti] [PP with] [NP meatballs]].

Syntactic Parsing

- Produce the correct syntactic parse tree for a sentence.

Semantic Tasks

Word Sense Disambiguation (WSD)

- Words in natural language usually have a fair number of different possible meanings.
  - Ellen has a strong interest in computational linguistics.
  - Ellen pays a large amount of interest on her credit card.
  - For many tasks (question answering, translation), the proper sense of each ambiguous word in a sentence must be determined.

Semantic Role Labeling (SRL)

- For each clause, determine the semantic role played by each noun phrase that is an argument to the verb.
  - John drove Mary from Austin to Dallas in his Toyota Prius.
  - The hammer broke the window.
- Also referred to as “case role analysis,” “thematic analysis,” and “shallow semantic parsing.”
Semantic Parsing

- A semantic parser maps a natural-language sentence to a complete, detailed semantic representation (logical form).
- For many applications, the desired output is immediately executable by another program.
- Example: Mapping an English database query to Prolog:
  How many cities are there in the US?
  answer(A, count(B, (city(B), loc(B, C)), const(C, countryid(USA))), A))

Textual Entailment

- Determine whether one natural language sentence entails (implies) another under an ordinary interpretation.
- E.g., “A soccer game with multiple males playing.” → Some men are playing a sport.”

Pragmatics/Discourse Tasks

- Determine which phrases in a document refer to the same underlying entity.
- John put the carrot on the plate and ate it.
- Bush started the war in Iraq. But the president needed the consent of Congress.
- Some cases require difficult reasoning.
- Today was Jack’s birthday. Penny and Janet went to the store. They were going to get presents. Janet decided to get a kite. “Don’t do that,” said Penny. “Jack has a kite. He will make you take it back.”

More Application-driven Tasks

- Information Extraction (IE)
  - Identify phrases in language that refer to specific types of entities and relations in text.
  - Named entity recognition is task of identifying names of people, places, organizations, etc. in text.
  - Michael Dell is the CEO of Dell Computer Corporation and lives in Austin Texas.
  - Relation extraction identifies specific relations between entities.
    - Michael Dell is the CEO of Dell Computer Corporation and lives in Austin Texas.
    - Michael Dell is the CEO of Dell Computer Corporation and lives in Austin Texas.
Question Answering
• Directly answer natural language questions based on information presented in a corpora of textual documents (e.g. the web).
  • Who is the president of United States?
    • Donald Trump
  • What is the popular of Massachusetts?
    • 6.8 million

Text Summarization
• Produce a short summary of one or many longer document(s).
  • Article: An international team of scientists studied diet and mortality in 135,335 people between 35 and 70 years old in 18 countries, following them for an average of more than seven years. Diet information depended on self-reports, and the scientists controlled for factors including age, sex, smoking, physical activity and body mass index. The study is in The Lancet. Compared with people who ate the lowest 20 percent of carbohydrates, those who ate the highest 20 percent had a 28 percent increased risk of death. But high carbohydrate intake was not associated with cardiovascular death...
  • Summary: Researchers found that people who ate higher amounts of carbohydrates had a higher risk of dying than those who ate more fats.

Spoken Dialogue Systems -- Chatbots
• Q: Is it going to rain today?
  • A: It will be mostly sunny. No rain is expected.

Machine Translation
• Translate a sentence from one natural language to another.
  • 我喜欢汉堡 → I like burgers.

Ambiguity Resolution is Required for Translation
• Syntactic and semantic ambiguities must be properly resolved for correct translation:
  • "John plays the guitar" → "John 吉他"
  • "John plays soccer" → "John 足球"

Ambiguity Resolution is Required for Translation
• Syntactic and semantic ambiguities must be properly resolved for correct translation:
  • "The spirit is willing but the flesh is weak." → "The liquor is good but the meat is spoiled."
  • "Out of sight, out of mind." → "Invisible idiot."
Resolving Ambiguity

- Choosing the correct interpretation of linguistic utterances requires (commonsense) knowledge of:
  - Syntax
  - Semantics
  - Michael and Ellen are names of people
  - August is the name of a month (and of a person)
  - Toyota is a car company and Prius is a brand of car
  - Pragmatics
  - Some social norm, communicative goal
  - Asking a question, expecting an answer
  - World knowledge
  - Credit cards require users to pay financial interest
  - Agents must be animate and a hammer is not animate

State-of-the-Arts

- Learning from large amounts of text data (cf. rule-based methods)
- Statistical machine learning-based methods
- The probabilistic knowledge acquired allows robust processing that handles linguistic regularities as well as exceptions.
- Now with neural network-based methods mostly
