Logistics

• Arrangement for the rest of the semester
  • This week: summarization, dialogue systems
  • March 19 (next Tuesday): guest lecture “Teaching Machines Like we Teach People” (the state-of-the-art dialogue systems and conversational agents) by Dr. Igor Labutov (co-founder of LAER.ai, Cornell CS PhD, CMU machine learning department post-doc), attendance required
  • March 22 (next Friday, last quiz): question answering
  • March 26 and 29: information extraction, discourse analysis; Friday lecture + office hour: project feedback for each team (will create piazza posts)
  • April 2 and 5: chatterbot, machine translation
  • April 9, 12, 16: course project presentation
  • April 26: final exam, 1-3pm, Forsyth Building 238

Text Summarization

• **Goal**: produce an abridged version of a text that contains information that is important or relevant to a user.

• **Summarization Applications**
  • *Outlines or abstracts* of any document, article, etc.
  • *Summaries* of email threads
  • *Action items* from a meeting
  • *Simplifying* text by compressing sentences

Example: “what is keto diet”
Example on Query-focused Summarization

- Query: “Cyberattacks by Russian”
- Summary for returned doc 1:
  - Over the last year, Russian hackers have gone from infiltrating business networks of energy, water and nuclear plants to worming their way into control rooms.
- Summary for returned doc 2:
  - The UK, US, France and Germany say there is no plausible alternative explanation to Russian responsibility.

What is the output

- Keywords
- Highlighted information in the input
- Chunks or speech directly from the input or paraphrase and aggregate the input in novel ways
- Modality: text, speech, video, graphics

What to summarize?
Single vs. multiple documents

- Single-document summarization
  - Given a single document, produce
    - abstract (a paragraph)
    - outline (bullet points)
    - headline (one sentence)
- Multiple-document summarization
  - Given a group of documents, produce a gist of the content:
    - a series of news stories on the same event
    - a set of web pages about some topic or question

Example: Scientific article summarization

- Single-document summarization task:
  - Not only what the article is about, but also how it relates to work it cites → summarize the article with regard to prior work
- Multi-document summarization task:
  - Determine which approaches are criticized and which are supported → summarize articles that cite a given article
  - more useful than original paper abstracts

Query-focused Summarization & Generic Summarization

- Generic summarization:
  - Summarize the content of a document
- Query-focused summarization:
  - Summarize a document with respect to an information need expressed in a user query.
  - a kind of complex question answering:
    - Answer a question by summarizing a document that has the information to construct the answer
Summarization for Question Answering or Search Engine: Featured Snippets

• Create snippets summarizing a web page for a query (could be paragraphs)

Extractive summarization & Abstractive summarization

• Extractive summarization:
  • create the summary from phrases or sentences in the source document(s)

• Abstractive summarization:
  • express the ideas in the source documents using (at least in part) different words

Extractive summarization

Sample article:
The Trump administration accused Russia on Thursday of engineering a series of cyberattacks that targeted American and European nuclear power plants and water and electric systems, and could have sabotaged or shut power plants off at will.

United States officials and private security firms saw the attacks as a signal by Moscow that it could disrupt the West’s critical facilities in the event of a conflict.

They said the strikes accelerated in late 2015, at the same time the Russian interference in the American election was underway. The attackers had compromised some operators in North America and Europe by spring 2017, after President Trump was inaugurated.

Extractive summarization: sentence-level

Sample article:
The Trump administration accused Russia on Thursday of engineering a series of cyberattacks that targeted American and European nuclear power plants and water and electric systems, and could have sabotaged or shut power plants off at will.

United States officials and private security firms saw the attacks as a signal by Moscow that it could disrupt the West’s critical facilities in the event of a conflict.

They said the strikes accelerated in late 2015, at the same time the Russian interference in the American election was underway. The attackers had compromised some operators in North America and Europe by spring 2017, after President Trump was inaugurated.

Extractive summarization: phrase-level

Sample article:
The Trump administration accused Russia on Thursday of engineering a series of cyberattacks that targeted American and European nuclear power plants and water and electric systems, and could have sabotaged or shut power plants off at will.

United States officials and private security firms saw the attacks as a signal by Moscow that it could disrupt the West’s critical facilities in the event of a conflict.

They said the strikes accelerated in late 2015, at the same time the Russian interference in the American election was underway. The attackers had compromised some operators in North America and Europe by spring 2017, after President Trump was inaugurated.
Abstractive Summarization

- Input: Congratulations to Australia for seeing sense and dropping the ridiculous policy of not selecting their best players if they are playing overseas.

- Summary: Australia have seen sense by revamping their overseas selection policy.

Most current systems

- Use shallow analysis methods (frequent words)
  - Rather than full understanding

- Work by sentence selection
  - Identify important sentences and piece them together to form a summary

Summarization: Three Stages

1. content selection: choose sentences to extract from the document
2. information ordering: choose an order to place them in the summary
3. sentence realization: clean up the sentences

Basic Summarization Algorithm (extractive)

1. content selection: choose sentences to extract from the document
2. information ordering: just use document order
3. sentence realization: keep original sentences

Unsupervised content selection
Frequency as document topic proxy

• Simple intuition, look only at the document(s)
  • Words that repeatedly appear in the document are likely to be related to the
    topic of the document (single document)
  • Sentences that repeatedly appear in different input documents represent
    themes in the input (multiple documents)

But what appears in other documents is also helpful in determining
the topic
  • Background corpus probabilities/weights for word

What is an article about?

• Word probability/frequency
  • Proposed by Luhn (Luhn 1958)
  • Frequent content words would be indicative of the topic of the article
  • In multi-document summarization, words or facts repeated in the
    input are more likely to appear in human summaries [Nenkova et al.,
    2006]

Main steps in sentence selection
according to word probabilities

• Step 1: estimate word weights (probabilities)
• Step 2: estimate sentence weights (how?)
• Step 3: choose best sentence
• Step 4: update word weights
• Step 5: go to step 2 if length not reached

Main steps in sentence selection
according to word probabilities

• Step 1: estimate word weights (probabilities)
• Step 2: estimate sentence weights (how?)
• Step 3: choose best sentence
• Step 4: update word weights (why?)
• Step 5: go to step 2 if length not reached
Main steps in sentence selection according to word probabilities

- Step 1: estimate word weights (probabilities)
- Step 2: estimate sentence weights
- Step 3: choose best sentence
- Step 4: update word weights
- Step 5: go to step 2 if length not reached

Obvious shortcomings of the pure frequency approaches

- Does not take account of paraphrases or related words
  - bombing -- explosion
  - suspects -- trail
  - Gadhafi -- Libya
- Does not take into account evidence from other documents
  - Function words: prepositions, articles, etc.
  - Domain words: "cell" in cell biology articles
- Does not take into account many other aspects!
  - Semantic in general

Salient words

- Intuition dating back to Luhn (1958):
  - Choose sentences that have salient or informative words
- Two approaches to defining salient words
  1. tf-idf: weigh each word $w$ in document $j$ by $\text{tf-idf}_{ij} = \text{tf}_i \times \text{idf}_j$
  2. topic signature: choose a smaller set of salient words
- Log likelihood ratio (LLR) test

Topic words (or topic signatures)

- Which words in the input are most descriptive?
- Instead of assigning probabilities or weights to all words, divide words into two classes: descriptive or not
- For iterative sentence selection approach, the binary distinction is key to the advantage over frequency and TF*IDF

Our focus

3/12/19
Example input and associated topic words

- Input for summarization: articles relevant to the following user need

**Title:** Human Toll of Tropical Storms Narrative: What has been the human toll in death or injury of tropical storms in recent years? Where and when have each of the storms caused human casualties? What are the approximate total number of casualties attributed to each of the storms?

**Topic Words**
- natural, ill, course, certificate, weather, wind, sick, ill, human, storm,台上, up, then, death, injury, storm, cause, casualties, total, number, attributed, storms.

Formalizing the problem of identifying topic words

- Given
  - t: a word that appears in the input
  - T: cluster of articles on a given topic (input)
  - NT: articles not on topic T (background corpus)
- Decide if t is a topic word or not
- Words that have (almost) the same probability in T and NT are not topic words

Testing which hypothesis is more likely: log-likelihood ratio test

- $H_0$: $P(T) = P(N|T) = p$ (if t is a descriptive term for the topic)
- $H_1$: $P(T) = p_1$ and $P(N|T) = p_2$ and $p_1 > p_2$ (t is a descriptive term)

Unsupervised content selection

- Topic signatures are assigned with weight of 1
- $\text{weight}(w_i) = \begin{cases} 1 & \text{if } -2 \log \Lambda(w_i) > 10 \\ 0 & \text{otherwise} \end{cases}$  Confidence level at 0.001
### Gisting

**ROUGE (Recall Oriented Understudy for Gisting Evaluation)**

- Intrinsic metric for automatically evaluating summaries
  - Not as good as human evaluation (“Did this answer the user’s question?”)
  - But much more convenient
- Given a document D, and an automatic summary X:
  1. Have N humans produce a set of reference summaries of D
  2. Run system, giving automatic summary X
  3. What percentage of the bigrams from the reference summaries appear in X?

\[
\text{ROUGE} - 2 = \frac{\sum_{i \in \text{Bigrams}} \min(\text{count}(i, D), \text{count}(i, S))}{\sum_{i \in \text{Bigrams}} \text{count}(i, D)}
\]

**A ROUGE example:**

Q: “What is water spinach?”

- Human 1: **Water spinach** is a green leafy vegetable grown in the tropics.
- Human 2: **Water spinach** is a semi-aquatic tropical plant grown as a vegetable.
- Human 3: **Water spinach** is a commonly eaten leaf vegetable of Asia.

- System answer: Water spinach is a leaf vegetable commonly eaten in tropical areas of Asia.

\[
\text{ROUGE-2} = \frac{3 + 3 + 6}{10 + 10 + 9} = \frac{12}{29} = .43
\]
Query-focused Summarization

• Or complex question answering

Definition questions

Q: What is water spinach?
A: Water spinach (Ipomoea aquatica) is a semi-aquatic leafy green plant with long hollow stems and spear- or heart-shaped leaves, widely grown throughout Asia as a leaf vegetable. The leaves and stems are often eaten stir-fried flavored with salt or in soups. Other common names include morning glory vegetable, kangkong (Malay), rau muong (Viet.), ong choi (Cant.), and kong xin cai (Mand.). It is not related to spinach, but is closely related to sweet potato and convolvulus.

Medical questions

Q: In children with an acute febrile illness, what is the efficacy of single medication therapy with acetaminophen or ibuprofen in reducing fever?
A: Ibuprofen provided greater temperature decrement and longer duration of antipyresis than acetaminophen when the two drugs were administered in approximately equal doses. (PubMedID: 1621668, Evidence Strength: A)

Other complex questions

1. How is compost made and used for gardening (including different types of compost, their uses, origins and benefits)?
2. What causes train wrecks and what can be done to prevent them?
3. Where have poachers endangered wildlife, what wildlife has been endangered and what steps have been taken to prevent poaching?
4. What has been the human toll in death or injury of tropical storms in recent years?

Answering harder questions:

Query-focused multi-document summarization

• The (bottom-up) snippet method
  • Find a set of relevant documents
  • Extract informative sentences from the documents
  • Order and modify the sentences into an answer
• The (top-down) information extraction method (upcoming lecture!)
  • build specific answerers for different question types:
    • definition questions
    • biography questions
    • certain medical questions

Query-focused Multi-document Summarization

Maximal Marginal Relevance (MMR)

• An iterative method for content selection from multiple documents
• Iteratively (greedily) choose the best sentence to insert in the summary/answer so far:
  • Relevant: Maximally relevant to the user’s query
  • high cosine similarity to the query
  • Novel: Minimally redundant with the summary/answer so far
  • low cosine similarity to the summary
• Stop when desired length
Information Ordering

• In what order to present the selected sentences?
  • An article with permuted sentences will not be easy to understand

• Very important for multi-document summarization
  • Sentences coming from different documents

Information Ordering

• Chronological ordering:
  • Order sentences by the date of the document (for summarizing news) (Barzilay, Elhadad, and McKeown 2002)

• Coherence:
  • Choose orderings that make neighboring sentences similar (by cosine),
  • Choose orderings in which neighboring sentences discuss the same entity (Barzilay and Lapata 2007)

• Topical ordering
  • Learn the ordering of topics in the source documents

Automatic summary edits: advanced topics

• Some expressions might not be appropriate in the new context
  • References:
    • Pinochet
    • Russian Prime Minister Vladimir Putin
  • Discourse connectives
    • However, moreover, subsequently

• Requires more sophisticated NLP techniques

Before and After

Pinochet was placed under arrest in London Friday by British police acting on a warrant issued by a Spanish judge. Pinochet has immunity from prosecution in Chile as a senator for life under a new constitution that his government crafted. Pinochet was detained in the London clinic while recovering from back surgery.

Gen. Augusto Pinochet, the former Chilean dictator, was placed under arrest in London Friday by British police acting on a warrant issued by a Spanish judge. Pinochet has immunity from prosecution in Chile as a senator for life under a new constitution that his government crafted. Pinochet was detained in the London clinic while recovering from back surgery.

Future Directions: Knowledge-based and Advanced Systems

• Discourse information -> coherent summaries

• Use external lexical resources -> redundancy detection
  • Wordnet, adjective polarity lists, opinion

• Using machine learning models -> neural network and reinforcement learning

• Towards abstractive summarization
