# Robotic Motion Planning: Sample-Based Motion Planning 

Robotics Institute 16-735<br>http://voronoi.sbp.ri.cmu.edu/~motion<br>Howie Choset<br>http://voronoi.sbp.ri.cmu.edu/~choset

## Rapidly-Exploring Random Trees (RRTs) [Kuffner, Lavalle]

The Basic RRT
single tree
bidirectional
multiple trees (forests)

RRTs with Differential Constraints nonholonomic
kinodynamic systems
closed chains

Some Observations and Analysis
number of branches
uniform convergence resolution completeness
leaf nodes vs. interior nodes

Performance \& Implementation Issues
Metrics and Metric sensitivity
Nearest neighbors
Collision Checking
Choosing appropriate step sizes

## High-Dimensional Planning as of 1999

## Single-Query:

Barraquand, Latombe '89; Mazer, Talbi, Ahuactzin, Bessiere '92; Hsu, Latombe, Motwani '97; Vallejo, Jones, Amato '99;

EXAMPLE: Potential-Field

TENSION

Greedy, can take a long time but good when you can dive into the solution

## Multiple-Query:

Kavraki, Svestka, Latombe, Overmars '95; Amato, Wu '96; Simeon, Laumound, Nissoux '99; Boor, Overmars, van der Stappen '99;

EXAMPLE: PRM

Spreads out like uniformity but need lots of sample to cover space

## Rapidly-Exploring Random Tree

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## Path Planning with RRTs (Rapidly-Exploring Random Trees)

```
BUILD_RRT (q quit ) {
    T.init(q}\mp@subsup{q}{ini}{})
    for }k=1\mathrm{ to K do
        q}\mp@subsup{q}{\mathrm{ rand }}{}=\mathrm{ RANDOM_CONFIG();
        EXTEND(T, q}\mp@subsup{q}{\mathrm{ rand }}{}
}
```

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## Path Planning with RRTs (Some Details)

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## RRT vs. Exhaustive Search

- Discrete

A* may try all edges

- Continuous

Continuum of choices

Probabilistically subsample all edges

## Naïve Random Tree

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## RRTs and Bias toward large Voronoi regions

http://msl.cs.uiuc.edu/rrt/gallery.html

## Biases

- Bias toward larger spaces
- Bias toward goal
- When generating a random sample, with some probability pick the goal instead of a random node when expanding
- This introduces another parameter
- James' experience is that $5-10 \%$ is the right choice
- If you do this $100 \%$, then this is a RPP

## RRT vs. RPP

RRT's will pull away and better approximate cost-to-go

## Grow two RRTs towards each other

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## A single RRT-Connect iteration...

## 1) One tree grown using random target

## 2) New node becomes target for other tree

## 3) Calculate node "nearest" to target

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## 4) Try to add new collision-free branch

## 5) If successful, keep extending branch

## 5) If successful, keep extending branch

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## 5) If successful, keep extending branch

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## 6) Path found if branch reaches target

## 7) Return path connecting start and goal

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## Basic RRT-Connect

Instead of switching, use $T_{a}$ as smaller tree. This helped James a lot

## $q_{\text {near }}$

$$
q^{\prime}=f(q, u)-- \text { use action } u \text { from } q \text { to arrive at } q^{\prime}
$$

chose $u_{*}=\arg \min \left(d\left(q_{r a n d}, q^{\prime}\right)\right)$

Is this the best?

Mixing position and velocity, actually mixing position, rotation and velocity is hard RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## So, what do they do?

- Use nearest neighbor anyway
- As long as heuristic is not bad, it helps
(you have already given up completeness and optimality, so what the heck?)
- Nearest neighbor calculations begin to dominate the collision avoidance (James says 50,000 nodes)
- Remember K-D trees

## Articulated Robot

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## Highly Articulated Robot

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## Hovercraft with 2 Thusters

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## Out of This World Demo

## Left-turn only forward car

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## Analysis

The limiting distribution of vertices:

- THEOREM: $\boldsymbol{X}_{\boldsymbol{k}}$ converges to $\boldsymbol{X}$ in probability
$\boldsymbol{X}_{\boldsymbol{k}}$ : The RRT vertex distribution at iteration $k$
$X$ : The distribution used for generating samples
- KEY IDEA: As the RRT reaches all of $Q_{\text {free }}$, the probability that $q_{\text {rand }}$ immediately becomes a new vertex approaches one.

# Rate of convergence: <br> - The probability that a path is found increases exponentially with the number of iterations. 

"This is the bain or the worst part of the algorithm," J. Kuffner

## Open Problems

Open Problems

- Rate of convergence
- Optimal sampling strategy?

Open Issues

- Metric Sensitivity
- Nearest-neighbor Efficiency

## Applications of RRTs

```
Robotics Applications
mobile robotics
manipulation
humanoids
Other Applications
biology (drug design)
manufacturing and virtual prototyping (assembly analysis)
verification and validation
computer animation and real-time graphics aerospace
RRT extensions discrete planning (STRIPS and Rubik's cube) real-time RRTs anytime RRTs
dynamic domain RRTs
deterministic RRTs
parallel RRTs
hybrid RRTs
```

## Diffusion Limited Aggregation

- Often used to model natural physical processes (e.g. snow accumulation, rust, etc.)

## Exploring Infinite Space

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## Polar Sampling

RI 16-735, Howie Choset with slides from Nancy Amato, Sujay Bhattacharjee, G.D. Hager, S. LaValle, and a lot from James Kuffner

## RRT Summary

Advantages

- Single parameter
- Balance between greedy search and exploration
- Converges to sampling distribution in the limit
- Simple and easy to implement

Disadvantages

- Metric sensitivity
- Nearest-neighbor efficiency
- Unknown rate of convergence
- "long tail" in computation time distribution

## PRT (Prob. Roadmap of Trees)

- Basic idea:
- Generate a set of trees in the configuration space
- Merge the trees by finding nodes that can be connected
- Algorithm
- pick several random nodes
- Generate trees $T_{1}, T_{2} \ldots T_{n}$ (EST or RRT)
- Merge trees
- generate a representative super-node
- Using PRS ideas to pick a neighborhood of trees
- $\Delta$ is now the tree-merge algorithm
- For planning
- generate trees from initial and goal nodes towards closest supernodes
- try to merge with "roadmap" of connected trees
- Note that PRS and tree-based algorithms are special cases
