## Path planning: BUGs and wavefront

How do you plan a path for a robot from start to goal?

## Start

## Path planning: BUGs and wavefront

Starting configuration

How do you plan a path for a robot from start to goal?

Goal configuration

## Problem we want to solve

Given:

- a point-robot (robot is a point in space)
- a start and goal configuration

Find:

- path from start to goal that does not result in a collision

Starting configuration

## Problem we want to solve

Given:

- a point-robot (robot is a point in space)
- a start and goal configuration

Find:

- path from start to goal that does not result in a collision

Assumptions:

- the position of the robot can always be measured perfectly
- the motion of the robot can always be controlled perfectly
- the robot can move in any directly instantaneously

## First attempt: BUGs!

## Bug algorithms:

- assume only local knowledge of the environment is available
- simple behaviors: follow a wall; follow straight line toward goal

## First attempt: BUG 0

## BUG 0:

1. head toward goal
2. if hit a wall, turn left
3. follow wall until a line toward goal will move you away from wall.
(assume we only have local sensing - we cannot sense position of walls we are not touching)

## First attempt: BUG 0

- start

What happens here?

## Second attempt: BUG 1

## BUG 1:

1. move on straight line toward goal
2. if obstacle encountered, circumnavigate entire obstacle and remember how close bug got to goal
3. return to closest point and continue on a straight line toward goal

## Second attempt: BUG 1

BUG 1:

1. move on straight line toward goal
2. if obstacle encountered, circumnavigate entire obstacle and remember how close bug got to goal
3. return to closest point and continue on a straight line toward goal

## BUG 1 Performance Analysis

How far does BUG 1 travel before reaching goal?

Best case scenario (lower bound): $D$

Worst case scenario (upper bound): $D+1.5 \sum_{i} P_{i}$

Where

- D denotes distance from start to goal and
- P_i denotes perimeter of ith obstacle

## BUG 1 completeness?

## Is BUG 1 complete?

- is it guaranteed to find a path if one exists?

Yes? No?

- how would you prove completeness (exercise for class)?

## Another bug: BUG 2

1. head toward goal on m-line

## Another bug: BUG 2

1. head toward goal on m-line
2. if you encounter obstacle, follow it until you encounter m-line again at a point closer to goal

## Another bug: BUG 2

1. head toward goal on m-line
2. if you encounter obstacle, follow it until you encounter m-line again at a point closer to goal
3. leave line and head toward goal again

## Another bug: BUG 2

Is BUG 2 complete?

- Why? Why not?

## Another bug: BUG 2

## Another bug: BUG 2

How bad can it get?

Lower bound:
D

Upper bound:

$$
D+\sum_{i} \frac{n_{i}}{2} P_{i}
$$

where n _ i is the number of s -line intersections In the ith obstacle.

## Wavefront planner (distance transform)

- intensity of a point denotes its (obstacle-respecting) distance from the goal

## Wavefront planner (distance transform)
