\section{Introduction}

The purpose of this package is to provide several methods for making boxes smaller, which extend (and some overlap with) \LaTeX’s \texttt{\llap} and \texttt{\rlap} commands. Most provided commands deal with making boxes of width 0pt, while anchoring the box in a specified place. For example, consider the following:

\begin{center}
\begin{tabular}{|l|l|}
\hline
\textbf{To get…} & \textbf{type…} \\
\hline
(Hello, world!) & (\texttt{\crushl(Hello, world!)}) \\
Hello, world! & (\texttt{\crushr(Hello, world!)}) \\
(3x^2 + 4x - 2) & (\texttt{\crushc(Hello, world!)}) \\
3x^2 + 4x - 2 & "(\crushl{3x^2 + 4x - 2})" \\
3x^2 + (4x - 2) & "(\crushr{3x^2 + 4x - 2})" \\
3 \pm \frac{z}{c} & "(\crushc{3x^2 + 4x - 2})" \\
Hello! & \texttt{\fbox{\crushl[1em]{Hello!}}} \\
\hline
\end{tabular}
\end{center}

There is also a command for minimizing the width of a box subject to not increasing its height. For example, to get this:

\begin{quote}
Whereas recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world, …
\end{quote}
...write this:
\mbox{\hfill\ shrinkbox\raggedleft
Whereas recognition of the inherent dignity and of the equal and
inalienable rights of all members of the human family is the
foundation of freedom, justice and peace in the world, \ldots}

In this case, \texttt{shrinkbox} found the narrowest box in which the given text fits on
3 lines, since given the space available it could not fit on fewer than 3 lines.

2 Command Reference

\begin{verbatim}
\crushl \langle dimen \rangle \{ \langle text \rangle \}
\crushr \langle dimen \rangle \{ \langle text \rangle \}
\crushc \langle dimen \rangle \{ \langle text \rangle \}
\end{verbatim}

These commands typeset \langle text \rangle in a horizontal box with width \langle dimen \rangle, which
defaults to 0pt. If the natural size of \langle text \rangle exceeds \langle dimen \rangle, then the text will
extend beyond the box, which means it is likely to overlap the surrounding text.
The direction of the overhang is determined by the choice of command:

\texttt{\crushl} anchors the left edge of the text to the left edge of the box, which may
cause it to hang out to the right.

\texttt{\crushr} anchors the right edge of the text to the right edge of the box, which
may cause it to hang out to the left.

\texttt{\crushc} anchors the center of the text to the center of the box, which may cause
the text to hang out to both sides.

\begin{verbatim}
\uncrushl \langle dimen \rangle \{ \langle text \rangle \}
\uncrushr \langle dimen \rangle \{ \langle text \rangle \}
\end{verbatim}

These commands kern by the width of \langle text \rangle, adjusted by \langle dimen \rangle, which
defaults to 0pt. In particular, \texttt{\uncrushl\langle dimen\rangle\langle text\rangle} moves to the left by
the width of \langle text \rangle less \langle dimen \rangle; \texttt{\uncrushr\langle dimen\rangle\langle text\rangle} moves to the
right by the width of \langle text \rangle plus \langle dimen \rangle. \texttt{\uncrushr\langle text\rangle} is equivalent to
\texttt{\phantom\langle text\rangle}.

\begin{verbatim}
\vcrush \langle pos \rangle \{ \langle width \rangle \} \{ \langle text \rangle \}
\end{verbatim}

This command is for crushing vertical-mode text. It sets \langle text \rangle in a box of width
\langle width \rangle (in the style of the \texttt{minipage} environment). It then crushes the box to
width and height 0px. The \langle pos \rangle argument specifies where with respect to the
text the new baseline of the box should be. It accepts all the same positions as
\shrinkbox \[\langle \text{pos} \rangle \]\[\langle \text{dimen} \rangle \] \{\langle \text{text} \rangle\}

This command typesets \langle \text{text} \rangle in the narrowest box such that its height does not increase. The optional argument \langle \text{dimen} \rangle provides the maximum width for the box, which otherwise defaults to \texttt{\linewidth}. This provides a minimal height for the box, and the width is then minimized until making it narrower still would increase the height. This may evaluate \langle \text{text} \rangle several times, so any side effects may happen an arbitrary number of times.

The optional argument \[\langle \text{pos} \rangle \] gives the vertical position of the text in the box, in the style of \texttt{\parbox}.

\textcrushl \[\langle \text{dimen} \rangle \] \{\langle \text{text} \rangle\}
\textcrushr \[\langle \text{dimen} \rangle \] \{\langle \text{text} \rangle\}
\textcrushc \[\langle \text{dimen} \rangle \] \{\langle \text{text} \rangle\}
\textuncrushl \[\langle \text{dimen} \rangle \] \{\langle \text{text} \rangle\}
\textuncrushr \[\langle \text{dimen} \rangle \] \{\langle \text{text} \rangle\}

The crushing and uncrushing commands normally select text or math mode automatically, but in case they get confused, these are the same commands specialized for text mode.

\mathcrushl \[\langle \text{dimen} \rangle \] \{\langle \text{math} \rangle\}
\mathcrushr \[\langle \text{dimen} \rangle \] \{\langle \text{math} \rangle\}
\mathcrushc \[\langle \text{dimen} \rangle \] \{\langle \text{math} \rangle\}
\mathuncrushl \[\langle \text{dimen} \rangle \] \{\langle \text{math} \rangle\}
\mathuncrushr \[\langle \text{dimen} \rangle \] \{\langle \text{math} \rangle\}

These are the commands specialized for math mode.

3 Implementation

3.1 Crushing Boxes

\crusher A box in which to save stuff to crush:
\newsavebox{\crusher}
\crushl The main horizontal-mode crushing commands dispatch based on whether we’re currently in math mode or text mode:
\crushr \[\langle \text{dimen} \rangle \] \{\langle \text{text} \rangle\}
\crushc 2 \newcommand{\crushl}{% \mathcrushl \{\langle \text{math} \rangle\}
\uncrushl 3 \ifmmode{\crushl}\else{\textcrushl}\fi
\crushr 4 \}}
\newcommand\crushr{{\%\ifmmode\aftergroup\mathcrushr\else\aftergroup\textcrushr\fi}}\newcommand\crushc{{\%\ifmmode\aftergroup\mathcrushc\else\aftergroup\textcrushc\fi}}\newcommand\uncrushl{{\%\ifmmode\aftergroup\mathuncrushl\else\aftergroup\textuncrushl\fi}}\newcommand\uncrushr{{\%\ifmmode\aftergroup\mathuncrushr\else\aftergroup\textuncrushr\fi}}\mathcrush@helper\m@thcrush@helper\mathcrush@helper{⟨cmd⟩}{⟨math⟩} → ⟨cmd⟩{⟨style⟩}{⟨math⟩}, where ⟨style⟩ is the current math style.\newcommand\mathcrush@helper[1]{\mathpalette{\m@thcrush@helper}{#1}}\newcommand\mathcrushl[1][0pt]{\mathcrush@helper{\textcrushl[#1]}}\newcommand\mathcrushr[1][0pt]{\mathcrush@helper{\textcrushr[#1]}}\newcommand\mathcrushc[1][0pt]{\mathcrush@helper{\textcrushc[#1]}}\newcommand\mathuncrushl[1][0pt]{\mathcrush@helper{\textuncrushl[#1]}}\newcommand\mathuncrushr[1][0pt]{\mathcrush@helper{\textuncrushr[#1]}}\textcrushl This is the implementation of \crushl for text mode. It sets the text in a box, drops the box in it right away, then kerns backward by its width and adjusts by any kern requested in the optional argument:  
\newcommand\textcrushl[2][0pt]{%  \sbox{\crusher}{#2}\%\usebox{\crusher}\kern-\wd\crusher\kern#1%  }\textcrushr This is the implementation of \crushr for text mode. It sets the text in a box, kerns backward by its width, adjusts by any kern requested in the optional argument, and then drops in the box:  
\newcommand\textcrushr[2][0pt]{%  \sbox{\crusher}{#2}\%\kern-\wd\crusher\kern#1%\usebox{\crusher}  }
\textcrushc

For \textcrushc we need to do half of the adjustment on each side of actually using the box. We use a dimension register to parse any user-specified adjustment so that we can then multiply that by 0.5.

\textcrushcl
\textcrushr

For uncrushing, we just measure the text and then kern either its width or the negation of its width:

\vcrush

This is a little more complicated, as we have to handle the T position ourselves, and its necessary to deal with both width and height.

\begin{minipage}

\setlength\hspace{\wd\crusher}
\ifx T#1\relax
\usebox\crusher
\vskip-\ht\crusher
\vskip-\dp\crusher
\else
\usebox\crusher
\vskip-\ht\crusher
\vskip-\dp\crusher
\fi
\end{minipage}
For anything but $T$, \texttt{minipage} already put the baseline in the right place, so we adjust away the height of the box before dropping in the box and the depth afterward:

\begin{verbatim}
69 \vskip-\ht\crusher
70 \usebox\crusher
71 \vskip-\dp\crusher
72 \fi
73 }%
74 }%
75 \usebox\crusher
76 }
\end{verbatim}

### 3.2 Shrinking Boxes

We use binary search on the width of the box, under the constraint that the height does not increase.

\begin{verbatim}
\shrinkboxheighttolerance \shrinkboxwidthtolerance
\end{verbatim}

First, we define the tolerances for the search. We default to a height tolerance of 0.5ex, because different line breaking may cause slight adjustments in the height of a box without changing the number of lines in the box. The width tolerance of 1pt means that we should find a box within 1pt of the narrowest possible box.

\begin{verbatim}
77 \newlength{\shrinkboxheighttolerance}
78 \newlength{\shrinkboxwidthtolerance}
79 \setlength{\shrinkboxheighttolerance}{0.5ex}
80 \setlength{\shrinkboxwidthtolerance}{1pt}
\end{verbatim}

\@shrink@box@a We’ll use two boxes in our binary search. At any given time, \@shrink@box@a will be narrower than \@shrink@box@b. We also maintain the invariant that \ht\@shrink@box@b doesn’t increase above the initial height of the maximum width box.

\begin{verbatim}
81 \newsavebox{\@shrink@box@a}
82 \newsavebox{\@shrink@box@b}
\end{verbatim}

\@shrink@box@ht \@shrink@box@wd These are temporaries for when we have to measure and compare boxes:

\begin{verbatim}
83 \newdimen{\shrink@box@ht}
84 \newdimen{\shrink@box@wd}
\end{verbatim}

\shrinkbox We need to handle two optional arguments. Here we check for the first, \texttt{(pos)}, and dispatch to \texttt{\shrinkbox@pos} to receive it if it is supplied, or default it to \texttt{c} and the width to \texttt{\linewidth}, otherwise.

\begin{verbatim}
85 \newcommand{\shrinkbox}{%
86 \@ifnextchar [ {\shrinkbox@start{c}{\linewidth}}%
87 }
88 \shrinkbox@pos
89 }
\end{verbatim}
Here we get the optional argument \texttt{pos} and check if there's a second, which would be \texttt{width}. If the second optional argument isn't supplied, the default is \texttt{linewidth}.

\begin{Verbatim}
\def\shrinkbox@pos[#1]{%
  \@ifnextchar [ {
    \shrinkbox@width[#1]}
  \shrinkbox@start[#1]{\linewidth}}%
\end{Verbatim}

\begin{Verbatim}
\def\shrinkbox@width#1[#2]{%
  \shrinkbox@start{#1}{#2}%
}\end{Verbatim}

Here we initialize the parameters for the binary search. We start the maximum width as the supplied \texttt{width} (which defaults to \texttt{linewidth}, and try setting the text with that width and $\frac{1}{10}$ of that width. We then start the loop, passing it \texttt{pos} and \texttt{text}, since we will likely have to set the text again.

\begin{Verbatim}
\newcommand\shrinkbox@start[3]{%
  \setlength{\@shrink@box@wd}{#2}%
  \sbox\@shrink@box@a{\parbox[#1]{0.1\@shrink@box@wd}{#3}}%
  \sbox\@shrink@box@b{\parbox[#1]{\@shrink@box@wd}{#3}}%
  \def\shrink@box@kont{\shrink@box@loop{#1}{#3}}%
  \shrink@box@kont%
}\end{Verbatim}

This is the main loop for the binary search.

\begin{Verbatim}
\newcommand\shrink@box@loop[2]{%
  \setlength{\@shrink@box@ht}{\ht\@shrink@box@a}
  \addtolength{\@shrink@box@ht}{\dp\@shrink@box@a}
  \addtolength{\@shrink@box@ht}{-\ht\@shrink@box@b}
  \addtolength{\@shrink@box@ht}{-\dp\@shrink@box@b}
  \setlength{\@shrink@box@wd}{\wd\@shrink@box@b}
  \addtolength{\@shrink@box@wd}{-\wd\@shrink@box@a}
  \addtolength{\@shrink@box@wd}{-\@shrink@box@wd}
  \setlength{\@shrink@box@ht}{\ht\@shrink@box@ht}
  \addtolength{\@shrink@box@ht}{\dp\@shrink@box@ht}
  \addtolength{\@shrink@box@ht}{-\ht\@shrink@box@ht}
  \addtolength{\@shrink@box@ht}{-\dp\@shrink@box@ht}
  \@ifdim\@shrink@box@ht<\shrinkboxheighttolerance{
    \@ifdim\@shrink@box@wd<\shrinkboxwidthtolerance{
      \shrink@box@kont%
    }{\shrink@box@loop[2]{}}}
\end{Verbatim}

Check if the heights of the two boxes are within the tolerance. If they are, then we should search narrower, but if the heights are very different, this means the narrow box is too narrow.

\begin{Verbatim}
\ifdim\@shrink@box@ht<\shrinkboxheighttolerance%
  \ifdim\@shrink@box@wd<\shrinkboxwidthtolerance%
    \shrink@box@kont%
  \else
    \shrink@box@loop[2]{}
  \fi
\else
  \shrink@box@loop[2]{}
\fi
\end{Verbatim}

Check the widths are within the tolerance. If they are, then the search is done, since the two boxes have met.

\begin{Verbatim}
\ifdim\@shrink@box@ht<\shrinkboxheighttolerance%
  \ifdim\@shrink@box@wd<\shrinkboxwidthtolerance%
    \shrink@box@kont%
  \else
    \shrink@box@loop[2]{}
  \fi
\else
  \shrink@box@loop[2]{}
\fi
\end{Verbatim}

\pagebreak
\shrink@box@kont We set \shrink@box@kont to what we want to do next, which is to use the smaller box (though it shouldn’t matter, since they’re the same size):
\begin{verbatim}
def\shrink@box@kont{\mbox{\usebox{\@shrink@box@a}}}%
\end{verbatim}
Here the heights are the same but the width are different, so we need to make the wide box narrower. We begin by getting the mean of the width of the boxes in \@shrink@box@wd:
\begin{verbatim}
\else
\setlength{\@shrink@box@wd}{0.5\@shrink@box@wd}%
\addtolength{\@shrink@box@wd}{\wd{\@shrink@box@a}}%
\fi
\end{verbatim}
Then replace the context of the wider box with a new box of the average width:
\begin{verbatim}
\sbox{\@shrink@box@b}{\parbox{[#1]{\@shrink@box@wd}{#2}}}%
\fi
\end{verbatim}
Here the heights are different, so the narrower box needs to get wider. Again we get the mean box width, but we use it to replace the narrower box.
\begin{verbatim}
\else
\setlength{\@shrink@box@wd}{0.5\@shrink@box@wd}%
\addtolength{\@shrink@box@wd}{\wd{\@shrink@box@a}}%
\sbox{\@shrink@box@a}{\parbox{[#1]{\@shrink@box@wd}{#2}}}%
\fi
\end{verbatim}
Back in \shrinkbox@start, we initialized \shrink@box@kont to run the loop each time. Here, it will recur unless we’ve determined that it’s time to stop and redefine it to actually output the box.
\begin{verbatim}
\shrink@box@kont}
\end{verbatim}
