# A Gentle Introduction to Gradient Boosting 

Cheng Li<br>chengli@ccs.neu.edu<br>College of Computer and Information Science Northeastern University

## Gradient Boosting

- a powerful machine learning algorithm
- it can do
- regression
- classification
- ranking
- won Track 1 of the Yahoo Learning to Rank Challenge

Our implementation of Gradient Boosting is available at https://github.com/cheng-li/pyramid

## Outline of the Tutorial

1 What is Gradient Boosting
2 A brief history
3 Gradient Boosting for regression
4 Gradient Boosting for classification
5 A demo of Gradient Boosting
6 Relationship between Adaboost and Gradient Boosting
7 Why it works
Note: This tutorial focuses on the intuition. For a formal treatment, see [Friedman, 2001]

## What is Gradient Boosting

## Gradient Boosting $=$ Gradient Descent + Boosting

Adaboost

Figure: AdaBoost. Source: Figure 1.1 of [Schapire and Freund, 2012]

## What is Gradient Boosting

## Gradient Boosting $=$ Gradient Descent + Boosting

Adaboost

Figure: AdaBoost. Source: Figure 1.1 of [Schapire and Freund, 2012]

- Fit an additive model (ensemble) $\sum_{t} \rho_{t} h_{t}(x)$ in a forward stage-wise manner.
- In each stage, introduce a weak learner to compensate the shortcomings of existing weak learners.
- In Adaboost, "shortcomings" are identified by high-weight data points.

## What is Gradient Boosting

## Gradient Boosting $=$ Gradient Descent + Boosting

Adaboost

$$
H(x)=\sum_{t} \rho_{t} h_{t}(x)
$$

Figure: AdaBoost. Source: Figure 1.2 of [Schapire and Freund, 2012]

## What is Gradient Boosting

## Gradient Boosting $=$ Gradient Descent + Boosting

Gradient Boosting

- Fit an additive model (ensemble) $\sum_{t} \rho_{t} h_{t}(x)$ in a forward stage-wise manner.
- In each stage, introduce a weak learner to compensate the shortcomings of existing weak learners.
- In Gradient Boosting, "shortcomings" are identified by gradients.
- Recall that, in Adaboost, "shortcomings" are identified by high-weight data points.
- Both high-weight data points and gradients tell us how to improve our model.

## What is Gradient Boosting

Why and how did researchers invent Gradient Boosting?

## A Brief History of Gradient Boosting

- Invent Adaboost, the first successful boosting algorithm [Freund et al., 1996, Freund and Schapire, 1997]
- Formulate Adaboost as gradient descent with a special loss function[Breiman et al., 1998, Breiman, 1999]
- Generalize Adaboost to Gradient Boosting in order to handle a variety of loss functions
[Friedman et al., 2000, Friedman, 2001]

## Gradient Boosting for Regression

## Gradient Boosting for Different Problems

Difficulty:
regression $===>$ classification $===>$ ranking

## Gradient Boosting for Regression

Let's play a game...
You are given $\left(x_{1}, y_{1}\right),\left(x_{2}, y_{2}\right), \ldots,\left(x_{n}, y_{n}\right)$, and the task is to fit a model $F(x)$ to minimize square loss.
Suppose your friend wants to help you and gives you a model $F$.
You check his model and find the model is good but not perfect.
There are some mistakes: $F\left(x_{1}\right)=0.8$, while $y_{1}=0.9$, and $F\left(x_{2}\right)=1.4$ while $y_{2}=1.3 \ldots$. How can you improve this model?

## Gradient Boosting for Regression

Let's play a game...
You are given $\left(x_{1}, y_{1}\right),\left(x_{2}, y_{2}\right), \ldots,\left(x_{n}, y_{n}\right)$, and the task is to fit a model $F(x)$ to minimize square loss.
Suppose your friend wants to help you and gives you a model $F$. You check his model and find the model is good but not perfect. There are some mistakes: $F\left(x_{1}\right)=0.8$, while $y_{1}=0.9$, and $F\left(x_{2}\right)=1.4$ while $y_{2}=1.3 \ldots$. How can you improve this model? Rule of the game:

- You are not allowed to remove anything from $F$ or change any parameter in $F$.

## Gradient Boosting for Regression

Let's play a game...
You are given $\left(x_{1}, y_{1}\right),\left(x_{2}, y_{2}\right), \ldots,\left(x_{n}, y_{n}\right)$, and the task is to fit a model $F(x)$ to minimize square loss.
Suppose your friend wants to help you and gives you a model $F$. You check his model and find the model is good but not perfect. There are some mistakes: $F\left(x_{1}\right)=0.8$, while $y_{1}=0.9$, and $F\left(x_{2}\right)=1.4$ while $y_{2}=1.3 \ldots$. How can you improve this model? Rule of the game:

- You are not allowed to remove anything from $F$ or change any parameter in $F$.
- You can add an additional model (regression tree) $h$ to $F$, so the new prediction will be $F(x)+h(x)$.

## Gradient Boosting for Regression

Simple solution:
You wish to improve the model such that

$$
\begin{aligned}
& F\left(x_{1}\right)+h\left(x_{1}\right)=y_{1} \\
& F\left(x_{2}\right)+h\left(x_{2}\right)=y_{2} \\
& \ldots \\
& F\left(x_{n}\right)+h\left(x_{n}\right)=y_{n}
\end{aligned}
$$

## Gradient Boosting for Regression

Simple solution:
Or, equivalently, you wish

$$
\begin{aligned}
& h\left(x_{1}\right)=y_{1}-F\left(x_{1}\right) \\
& h\left(x_{2}\right)=y_{2}-F\left(x_{2}\right) \\
& \ldots \\
& h\left(x_{n}\right)=y_{n}-F\left(x_{n}\right)
\end{aligned}
$$

## Gradient Boosting for Regression

Simple solution:
Or, equivalently, you wish

$$
\begin{aligned}
& h\left(x_{1}\right)=y_{1}-F\left(x_{1}\right) \\
& h\left(x_{2}\right)=y_{2}-F\left(x_{2}\right) \\
& \ldots \\
& h\left(x_{n}\right)=y_{n}-F\left(x_{n}\right)
\end{aligned}
$$

Can any regression tree $h$ achieve this goal perfectly?

## Gradient Boosting for Regression

Simple solution:
Or, equivalently, you wish

$$
\begin{aligned}
& h\left(x_{1}\right)=y_{1}-F\left(x_{1}\right) \\
& h\left(x_{2}\right)=y_{2}-F\left(x_{2}\right) \\
& \ldots \\
& h\left(x_{n}\right)=y_{n}-F\left(x_{n}\right)
\end{aligned}
$$

Can any regression tree $h$ achieve this goal perfectly? Maybe not....

## Gradient Boosting for Regression

Simple solution:
Or, equivalently, you wish

$$
\begin{aligned}
& h\left(x_{1}\right)=y_{1}-F\left(x_{1}\right) \\
& h\left(x_{2}\right)=y_{2}-F\left(x_{2}\right) \\
& \ldots \\
& h\left(x_{n}\right)=y_{n}-F\left(x_{n}\right)
\end{aligned}
$$

Can any regression tree $h$ achieve this goal perfectly? Maybe not....
But some regression tree might be able to do this approximately.

## Gradient Boosting for Regression

Simple solution:
Or, equivalently, you wish

$$
\begin{aligned}
& h\left(x_{1}\right)=y_{1}-F\left(x_{1}\right) \\
& h\left(x_{2}\right)=y_{2}-F\left(x_{2}\right) \\
& \ldots \\
& h\left(x_{n}\right)=y_{n}-F\left(x_{n}\right)
\end{aligned}
$$

Can any regression tree $h$ achieve this goal perfectly? Maybe not....
But some regression tree might be able to do this approximately. How?

## Gradient Boosting for Regression

## Simple solution:

Or, equivalently, you wish

$$
\begin{aligned}
& h\left(x_{1}\right)=y_{1}-F\left(x_{1}\right) \\
& h\left(x_{2}\right)=y_{2}-F\left(x_{2}\right) \\
& \ldots \\
& h\left(x_{n}\right)=y_{n}-F\left(x_{n}\right)
\end{aligned}
$$

Can any regression tree $h$ achieve this goal perfectly? Maybe not....
But some regression tree might be able to do this approximately. How?
Just fit a regression tree $h$ to data
$\left(x_{1}, y_{1}-F\left(x_{1}\right)\right),\left(x_{2}, y_{2}-F\left(x_{2}\right)\right), \ldots,\left(x_{n}, y_{n}-F\left(x_{n}\right)\right)$

## Gradient Boosting for Regression

## Simple solution:

Or, equivalently, you wish

$$
\begin{aligned}
& h\left(x_{1}\right)=y_{1}-F\left(x_{1}\right) \\
& h\left(x_{2}\right)=y_{2}-F\left(x_{2}\right) \\
& \ldots \\
& h\left(x_{n}\right)=y_{n}-F\left(x_{n}\right)
\end{aligned}
$$

Can any regression tree $h$ achieve this goal perfectly? Maybe not....
But some regression tree might be able to do this approximately. How?
Just fit a regression tree $h$ to data
$\left(x_{1}, y_{1}-F\left(x_{1}\right)\right),\left(x_{2}, y_{2}-F\left(x_{2}\right)\right), \ldots,\left(x_{n}, y_{n}-F\left(x_{n}\right)\right)$
Congratulations, you get a better model!

## Gradient Boosting for Regression

## Simple solution:

$y_{i}-F\left(x_{i}\right)$ are called residuals. These are the parts that existing model $F$ cannot do well.
The role of $h$ is to compensate the shortcoming of existing model $F$.

## Gradient Boosting for Regression

## Simple solution:

$y_{i}-F\left(x_{i}\right)$ are called residuals. These are the parts that existing model $F$ cannot do well.
The role of $h$ is to compensate the shortcoming of existing model $F$.
If the new model $F+h$ is still not satisfactory,

## Gradient Boosting for Regression

## Simple solution:

$y_{i}-F\left(x_{i}\right)$ are called residuals. These are the parts that existing model $F$ cannot do well.
The role of $h$ is to compensate the shortcoming of existing model $F$.
If the new model $F+h$ is still not satisfactory, we can add another regression tree...

## Gradient Boosting for Regression

$y_{i}-F\left(x_{i}\right)$ are called residuals. These are the parts that existing model $F$ cannot do well.
The role of $h$ is to compensate the shortcoming of existing model $F$.
If the new model $F+h$ is still not satisfactory, we can add another regression tree...
We are improving the predictions of training data, is the procedure also useful for test data?

## Gradient Boosting for Regression

## Simple solution:

$y_{i}-F\left(x_{i}\right)$ are called residuals. These are the parts that existing model $F$ cannot do well.
The role of $h$ is to compensate the shortcoming of existing model $F$.
If the new model $F+h$ is still not satisfactory, we can add another regression tree...
We are improving the predictions of training data, is the procedure also useful for test data?
Yes! Because we are building a model, and the model can be applied to test data as well.

We are improving the predictions of training data, is the procedure also useful for test data?
Yes! Because we are building a model, and the model can be applied to test data as well.
How is this related to gradient descent?

## Gradient Boosting for Regression

## Gradient Descent

Minimize a function by moving in the opposite direction of the gradient.

$$
\theta_{i}:=\theta_{i}-\rho \frac{\partial J}{\partial \theta_{i}}
$$

Figure: Gradient Descent. Source:
http://en.wikipedia.org/wiki/Gradient_descent

## Gradient Boosting for Regression

How is this related to gradient descent?
Loss function $L(y, F(x))=(y-F(x))^{2} / 2$
We want to minimize $J=\sum_{i} L\left(y_{i}, F\left(x_{i}\right)\right)$ by adjusting
$F\left(x_{1}\right), F\left(x_{2}\right), \ldots, F\left(x_{n}\right)$.
Notice that $F\left(x_{1}\right), F\left(x_{2}\right), \ldots, F\left(x_{n}\right)$ are just some numbers. We can treat $F\left(x_{i}\right)$ as parameters and take derivatives

$$
\frac{\partial J}{\partial F\left(x_{i}\right)}=\frac{\partial \sum_{i} L\left(y_{i}, F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)}=\frac{\partial L\left(y_{i}, F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)}=F\left(x_{i}\right)-y_{i}
$$

So we can interpret residuals as negative gradients.

$$
y_{i}-F\left(x_{i}\right)=-\frac{\partial J}{\partial F\left(x_{i}\right)}
$$

## Gradient Boosting for Regression

How is this related to gradient descent?

$$
\begin{aligned}
F\left(x_{i}\right) & :=F\left(x_{i}\right)+h\left(x_{i}\right) \\
F\left(x_{i}\right) & :=F\left(x_{i}\right)+y_{i}-F\left(x_{i}\right) \\
F\left(x_{i}\right) & :=F\left(x_{i}\right)-1 \frac{\partial J}{\partial F\left(x_{i}\right)} \\
\theta_{i} & :=\theta_{i}-\rho \frac{\partial J}{\partial \theta_{i}}
\end{aligned}
$$

## Gradient Boosting for Regression

How is this related to gradient descent?
For regression with square loss,

$$
\text { residual } \Leftrightarrow \text { negative gradient }
$$

fit $h$ to residual $\Leftrightarrow$ fit $h$ to negative gradient
update $F$ based on residual $\Leftrightarrow$ update $F$ based on negative gradient

## Gradient Boosting for Regression

How is this related to gradient descent?
For regression with square loss,

$$
\text { residual } \Leftrightarrow \text { negative gradient }
$$

fit $h$ to residual $\Leftrightarrow$ fit $h$ to negative gradient
update $F$ based on residual $\Leftrightarrow$ update $F$ based on negative gradient
So we are actually updating our model using gradient descent!

## Gradient Boosting for Regression

## How is this related to gradient descent?

For regression with square loss,

$$
\text { residual } \Leftrightarrow \text { negative gradient }
$$

fit $h$ to residual $\Leftrightarrow$ fit $h$ to negative gradient
update $F$ based on residual $\Leftrightarrow$ update $F$ based on negative gradient
So we are actually updating our model using gradient descent! It turns out that the concept of gradients is more general and useful than the concept of residuals. So from now on, let's stick with gradients. The reason will be explained later.

## Gradient Boosting for Regression

## Regression with square Loss

Let us summarize the algorithm we just derived using the concept of gradients. Negative gradient:

$$
-g\left(x_{i}\right)=-\frac{\partial L\left(y_{i}, F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)}=y_{i}-F\left(x_{i}\right)
$$

start with an initial model, say, $F(x)=\frac{\sum_{i=1}^{n} y_{i}}{n}$
iterate until converge:
calculate negative gradients $-g\left(x_{i}\right)$
fit a regression tree $h$ to negative gradients $-g\left(x_{i}\right)$

$$
F:=F+\rho h, \text { where } \rho=1
$$

## Gradient Boosting for Regression

## Regression with square Loss

Let us summarize the algorithm we just derived using the concept of gradients. Negative gradient:

$$
-g\left(x_{i}\right)=-\frac{\partial L\left(y_{i}, F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)}=y_{i}-F\left(x_{i}\right)
$$

start with an initial model, say, $F(x)=\frac{\sum_{i=1}^{n} y_{i}}{n}$
iterate until converge:
calculate negative gradients $-g\left(x_{i}\right)$
fit a regression tree $h$ to negative gradients $-g\left(x_{i}\right)$
$F:=F+\rho h$, where $\rho=1$

The benefit of formulating this algorithm using gradients is that it allows us to consider other loss functions and derive the corresponding algorithms in the same way.

## Gradient Boosting for Regression

Loss Functions for Regression Problem
Why do we need to consider other loss functions? Isn't square loss good enough?

## Gradient Boosting for Regression

## Loss Functions for Regression Problem

Square loss is:
$\checkmark$ Easy to deal with mathematically
$\times$ Not robust to outliers
Outliers are heavily punished because the error is squared. Example:

| $y_{i}$ | 0.5 | 1.2 | 2 | $5^{*}$ |
| :---: | :---: | :---: | :---: | :---: |
| $F\left(x_{i}\right)$ | 0.6 | 1.4 | 1.5 | 1.7 |
| $L=(y-F)^{2} / 2$ | 0.005 | 0.02 | 0.125 | 5.445 |

## Gradient Boosting for Regression

## Loss Functions for Regression Problem

Square loss is:
$\checkmark$ Easy to deal with mathematically
$\times$ Not robust to outliers
Outliers are heavily punished because the error is squared. Example:

| $y_{i}$ | 0.5 | 1.2 | 2 | $5^{*}$ |
| :---: | :---: | :---: | :---: | :---: |
| $F\left(x_{i}\right)$ | 0.6 | 1.4 | 1.5 | 1.7 |
| $L=(y-F)^{2} / 2$ | 0.005 | 0.02 | 0.125 | 5.445 |

Consequence?
Pay too much attention to outliers. Try hard to incorporate outliers into the model. Degrade the overall performance.

## Gradient Boosting for Regression

Loss Functions for Regression Problem

- Absolute loss (more robust to outliers)

$$
L(y, F)=|y-F|
$$

## Gradient Boosting for Regression

Loss Functions for Regression Problem

- Absolute loss (more robust to outliers)

$$
L(y, F)=|y-F|
$$

- Huber loss (more robust to outliers)

$$
L(y, F)= \begin{cases}\frac{1}{2}(y-F)^{2} & |y-F| \leq \delta \\ \delta(|y-F|-\delta / 2) & |y-F|>\delta\end{cases}
$$

## Gradient Boosting for Regression

## Loss Functions for Regression Problem

- Absolute loss (more robust to outliers)

$$
L(y, F)=|y-F|
$$

- Huber loss (more robust to outliers)

$$
L(y, F)= \begin{cases}\frac{1}{2}(y-F)^{2} & |y-F| \leq \delta \\ \delta(|y-F|-\delta / 2) & |y-F|>\delta\end{cases}
$$

| $y_{i}$ | 0.5 | 1.2 | 2 | $5^{*}$ |
| :---: | :---: | :---: | :---: | :---: |
| $F\left(x_{i}\right)$ | 0.6 | 1.4 | 1.5 | 1.7 |
| Square loss | 0.005 | 0.02 | 0.125 | 5.445 |
| Absolute loss | 0.1 | 0.2 | 0.5 | 3.3 |
| Huber loss $(\delta=0.5)$ | 0.005 | 0.02 | 0.125 | 1.525 |

## Gradient Boosting for Regression

## Regression with Absolute Loss

Negative gradient:

$$
-g\left(x_{i}\right)=-\frac{\partial L\left(y_{i}, F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)}=\operatorname{sign}\left(y_{i}-F\left(x_{i}\right)\right)
$$

start with an initial model, say, $F(x)=\frac{\sum_{i=1}^{n} y_{i}}{n}$ iterate until converge:
calculate gradients $-g\left(x_{i}\right)$
fit a regression tree $h$ to negative gradients $-g\left(x_{i}\right)$
$F:=F+\rho h$

## Gradient Boosting for Regression

## Regression with Huber Loss

Negative gradient:

$$
\begin{aligned}
-g\left(x_{i}\right) & =-\frac{\partial L\left(y_{i}, F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)} \\
& = \begin{cases}y_{i}-F\left(x_{i}\right) & \left|y_{i}-F\left(x_{i}\right)\right| \leq \delta \\
\delta \operatorname{sign}\left(y_{i}-F\left(x_{i}\right)\right) & \left|y_{i}-F\left(x_{i}\right)\right|>\delta\end{cases}
\end{aligned}
$$

start with an initial model, say, $F(x)=\frac{\sum_{i=1}^{n} y_{i}}{n}$ iterate until converge:
calculate negative gradients $-g\left(x_{i}\right)$
fit a regression tree $h$ to negative gradients $-g\left(x_{i}\right)$

$$
F:=F+\rho h
$$

## Gradient Boosting for Regression

Regression with loss function $L$ : general procedure
Give any differentiable loss function $L$
start with an initial model, say $F(x)=\frac{\sum_{i=1}^{n} y_{i}}{n}$
iterate until converge:
calculate negative gradients $-g\left(x_{i}\right)=-\frac{\partial L\left(y_{i}, F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)}$ fit a regression tree $h$ to negative gradients $-g\left(x_{i}\right)$

$$
F:=F+\rho h
$$

## Gradient Boosting for Regression

Regression with loss function $L$ : general procedure
Give any differentiable loss function $L$
start with an initial model, say $F(x)=\frac{\sum_{i=1}^{n} y_{i}}{n}$
iterate until converge:
calculate negative gradients $-g\left(x_{i}\right)=-\frac{\partial L\left(y_{i}, F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)}$
fit a regression tree $h$ to negative gradients $-g\left(x_{i}\right)$

$$
F:=F+\rho h
$$

In general,

$$
\text { negative gradients } \Leftrightarrow \text { residuals }
$$

We should follow negative gradients rather than residuals. Why?

## Gradient Boosting for Regression

## Negative Gradient vs Residual: An Example

Huber loss

$$
L(y, F)= \begin{cases}\frac{1}{2}(y-F)^{2} & |y-F| \leq \delta \\ \delta(|y-F|-\delta / 2) & |y-F|>\delta\end{cases}
$$

Update by Negative Gradient:

$$
h\left(x_{i}\right)=-g\left(x_{i}\right)= \begin{cases}y_{i}-F\left(x_{i}\right) & \left|y_{i}-F\left(x_{i}\right)\right| \leq \delta \\ \delta \operatorname{sign}\left(y_{i}-F\left(x_{i}\right)\right) & \left|y_{i}-F\left(x_{i}\right)\right|>\delta\end{cases}
$$

Update by Residual:

$$
h\left(x_{i}\right)=y_{i}-F\left(x_{i}\right)
$$

Difference: negative gradient pays less attention to outliers.

## Gradient Boosting for Regression

## Summary of the Section

- Fit an additive model $F=\sum_{t} \rho_{t} h_{t}$ in a forward stage-wise manner.
- In each stage, introduce a new regression tree $h$ to compensate the shortcomings of existing model.
- The "shortcomings" are identified by negative gradients.
- For any loss function, we can derive a gradient boosting algorithm.
- Absolute loss and Huber loss are more robust to outliers than square loss.

Things not covered
How to choose a proper learning rate for each gradient boosting algorithm. See [Friedman, 2001]

## Gradient Boosting for Classification

## Problem

Recognize the given hand written capital letter.

- Multi-class classification
- 26 classes. A,B,C,...,Z

## Data Set

- http://archive.ics.uci.edu/ml/datasets/Letter+ Recognition
- 20000 data points, 16 features

## Gradient Boosting for Classification

## Feature Extraction

| 1 | horizontal position of box | 9 | mean $y$ variance |
| :---: | :---: | :---: | :---: |
| 2 | vertical position of box | 10 | mean $\times y$ correlation |
| 3 | width of box | 11 | mean of $x^{*} x^{*} y$ |
| 4 | height of box | 12 | mean of $x^{*} y^{*} y$ |
| 5 | total number on pixels | 13 | mean edge count left to right |
| 6 | mean $x$ of on pixels in box | 14 | correlation of $x$-ege with $y$ |
| 7 | mean $y$ of on pixels in box | 15 | mean edge count bottom to top |
| 8 | mean $x$ variance | 16 | correlation of $y$-ege with $x$ |

Feature Vector $=(2,1,3,1,1,8,6,6,6,6,5,9,1,7,5,10)$
Label $=G$

## Gradient Boosting for Classification

## Model

- 26 score functions (our models): $F_{A}, F_{B}, F_{C}, \ldots, F_{Z}$.
- $F_{A}(x)$ assigns a score for class $A$
- scores are used to calculate probabilities

$$
\begin{aligned}
& P_{A}(x)=\frac{e^{F_{A}(x)}}{\sum_{c=A}^{Z} e^{F_{c}(x)}} \\
& P_{B}(x)=\frac{e^{F_{B}(x)}}{\sum_{c=A}^{Z} e^{F_{c}(x)}} \\
& \ldots \\
& P_{Z}(x)=\frac{e^{F_{Z}(x)}}{\sum_{c=A}^{Z} e^{F_{c}(x)}}
\end{aligned}
$$

- predicted label $=$ class that has the highest probability

Loss Function for each data point
Step 1 turn the label $y_{i}$ into a (true) probability distribution $Y_{c}\left(x_{i}\right)$ For example: $y_{5}=\mathrm{G}$, $Y_{A}\left(x_{5}\right)=0, Y_{B}\left(x_{5}\right)=0, \ldots, Y_{G}\left(x_{5}\right)=1, \ldots, Y_{Z}\left(x_{5}\right)=0$

## Gradient Boosting for Classification

Figure: true probability distribution

Loss Function for each data point
Step 1 turn the label $y_{i}$ into a (true) probability distribution $Y_{c}\left(x_{i}\right)$ For example: $y_{5}=\mathrm{G}$, $Y_{A}\left(x_{5}\right)=0, Y_{B}\left(x_{5}\right)=0, \ldots, Y_{G}\left(x_{5}\right)=1, \ldots, Y_{Z}\left(x_{5}\right)=0$
Step 2 calculate the predicted probability distribution $P_{c}\left(x_{i}\right)$ based on the current model $F_{A}, F_{B}, \ldots, F_{Z}$. $P_{A}\left(x_{5}\right)=0.03, P_{B}\left(x_{5}\right)=0.05, \ldots, P_{G}\left(x_{5}\right)=0.3, \ldots, P_{Z}\left(x_{5}\right)=$ 0.05

## Gradient Boosting for Classification

Figure: predicted probability distribution based on current model

## Loss Function for each data point

Step 1 turn the label $y_{i}$ into a (true) probability distribution $Y_{c}\left(x_{i}\right)$ For example: $y_{5}=\mathrm{G}$,
$Y_{A}\left(x_{5}\right)=0, Y_{B}\left(x_{5}\right)=0, \ldots, Y_{G}\left(x_{5}\right)=1, \ldots, Y_{Z}\left(x_{5}\right)=0$
Step 2 calculate the predicted probability distribution $P_{c}\left(x_{i}\right)$ based on the current model $F_{A}, F_{B}, \ldots, F_{Z}$.
$P_{A}\left(x_{5}\right)=0.03, P_{B}\left(x_{5}\right)=0.05, \ldots, P_{G}\left(x_{5}\right)=0.3, \ldots, P_{Z}\left(x_{5}\right)=$ 0.05

Step 3 calculate the difference between the true probability distribution and the predicted probability distribution. Here we use KL-divergence

## Gradient Boosting for Classification

## Goal

- minimize the total loss (KL-divergence)
- for each data point, we wish the predicted probability distribution to match the true probability distribution as closely as possible

## Gradient Boosting for Classification

## Gradient Boosting for Classification

Goal

- minimize the total loss (KL-divergence)
- for each data point, we wish the predicted probability distribution to match the true probability distribution as closely as possible
- we achieve this goal by adjusting our models $F_{A}, F_{B}, \ldots, F_{Z}$.

## Gradient Boosting for Regression: Review

Regression with loss function $L$ : general procedure Give any differentiable loss function $L$
start with an initial model $F$
iterate until converge:
calculate negative gradients $-g\left(x_{i}\right)=-\frac{\partial L\left(y_{i} ; F\left(x_{i}\right)\right)}{\partial F\left(x_{i}\right)}$
fit a regression tree $h$ to negative gradients $-g\left(x_{i}\right)$
$F:=F+\rho h$

## Gradient Boosting for Classification

## Differences

- $F_{A}, F_{B}, \ldots, F_{Z}$ vs $F$
- a matrix of parameters to optimize vs a column of parameters to optimize

| $F_{A}\left(x_{1}\right)$ | $F_{B}\left(x_{1}\right)$ | $\ldots$ | $F_{Z}\left(x_{1}\right)$ |
| :---: | :---: | :---: | :---: |
| $F_{A}\left(x_{2}\right)$ | $F_{B}\left(x_{2}\right)$ | $\ldots$ | $F_{Z}\left(x_{2}\right)$ |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| $F_{A}\left(x_{n}\right)$ | $F_{B}\left(x_{n}\right)$ | $\ldots$ | $F_{Z}\left(x_{n}\right)$ |

- a matrix of gradients vs a column of gradients

| $\frac{\partial L}{F_{A}\left(x_{1}\right)}$ | $\frac{\partial L}{F_{B}\left(x_{1}\right)}$ | $\cdots$ | $\frac{\partial L}{F_{Z}\left(x_{1}\right)}$ |
| :---: | :---: | :---: | :---: |
| $\frac{A L}{F_{A}\left(x_{2}\right)}$ | $\frac{\partial L}{F_{B}\left(x_{2}\right)}$ | $\cdots$ | $\frac{Z L}{F_{Z}\left(x_{2}\right)}$ |
| $\cdots$ | $\cdots$ | $\cdots$ | $\cdots$ |
| $\frac{\partial L}{F_{A}\left(x_{n}\right)}$ | $\frac{\partial L}{F_{B}\left(x_{n}\right)}$ | $\cdots$ | $\frac{\partial L}{F_{Z}\left(x_{n}\right)}$ |

## Gradient Boosting for Classification

start with initial models $F_{A}, F_{B}, F_{C}, \ldots, F_{Z}$
iterate until converge:
calculate negative gradients for class A: $-g_{A}\left(x_{i}\right)=-\frac{\partial L}{\partial F_{A}\left(x_{i}\right)}$
calculate negative gradients for class $\mathrm{B}:-g_{B}\left(x_{i}\right)=-\frac{\partial L}{\partial F_{B}\left(x_{i}\right)}$
calculate negative gradients for class $Z:-g_{Z}\left(x_{i}\right)=-\frac{\partial L}{\partial F_{Z}\left(x_{i}\right)}$
fit a regression tree $h_{A}$ to negative gradients $-g_{A}\left(x_{i}\right)$
fit a regression tree $h_{B}$ to negative gradients $-g_{B}\left(x_{i}\right)$
fit a regression tree $h_{Z}$ to negative gradients $-g_{Z}\left(x_{i}\right)$
$F_{A}:=F_{A}+\rho_{A} h_{A}$
$F_{B}:=F_{A}+\rho_{B} h_{B}$
$F_{Z}:=F_{A}+\rho_{Z} h_{Z}$

## Gradient Boosting for Classification

start with initial models $F_{A}, F_{B}, F_{C}, \ldots, F_{Z}$
iterate until converge:
calculate negative gradients for class $\mathrm{A}:-g_{A}\left(x_{i}\right)=Y_{A}\left(x_{i}\right)-P_{A}\left(x_{i}\right)$
calculate negative gradients for class $\mathrm{B}:-g_{B}\left(x_{i}\right)=Y_{B}\left(x_{i}\right)-P_{B}\left(x_{i}\right)$
calculate negative gradients for class $Z:-g_{Z}\left(x_{i}\right)=Y_{Z}\left(x_{i}\right)-P_{Z}\left(x_{i}\right)$
fit a regression tree $h_{A}$ to negative gradients $-g_{A}\left(x_{i}\right)$
fit a regression tree $h_{B}$ to negative gradients $-g_{B}\left(x_{i}\right)$
fit a regression tree $h_{Z}$ to negative gradients $-g_{Z}\left(x_{i}\right)$
$F_{A}:=F_{A}+\rho_{A} h_{A}$
$F_{B}:=F_{A}+\rho_{B} h_{B}$
$F_{Z}:=F_{A}+\rho_{Z} h_{Z}$
