Brendan Wilson

Treatment Tracker Evaluation
Task 1: You need to take heart medication prescribed by your doctor. Use the system to find out when to take it as well as any other instructions for taking the medication. Then use the system to find out more about the medication.
  ● This task was pretty easy to complete. The information on scheduling was available right at the start, and it was obvious what I needed to click to get more information.

Task 2: You need to do physical therapy but have forgotten how to do your exercises. Use the system to get instructions on the first exercise, and then find out how long you need to rest between exercises.
  ● Similar to the first task, it was pretty easy to determine what I needed to click to get to the information on how to do the exercises.

Task 3: You have an x-ray in two days. Set a reminder for tomorrow so that you can do the prescribed preparation, then set an alarm for the morning of the procedure.
  ● The ‘Set Alert’ button was pretty easy to find for this one. The actual interface for setting an alert was good, but it was unclear what the space to the right of it was until I added the event.

Heuristics:
Simple/Natural Dialog
  ● No issues here, all of the buttons and text was easy to understand, I didn’t find that I was questioning anything.

Speak The User’s language
  ● Didn’t have any issues understanding any of the dialogues, menus or buttons.

Minimize User Memory Load
  ● Didn’t have any trouble with this, most of the information was present on every screen.

Consistency
  ● I would say the only issues right now are that some of the buttons don’t do anything or provide any sort of dialogues, while some do. This is most likely just a result of it being an early prototype though.

Feedback
  ● The system was responsive enough that feedback was never an issue.

Clearly Marked exits
  ● I would say that this was good, however I was a little unclear as to what exiting the Alert interface window would do, if the alert would stay or not.

Shortcuts
  ● I don’t think the tasks went into enough detail that I had to worry about shortcuts. I think the system is pretty straightforward and shortcuts aren’t a huge worry at this point.

Good Error Messages
  ● I didn’t encounter any error messages.

Prevent errors
  ● Didn’t really encounter any errors.
Help/Documentation

- I found the tasks to be simple enough that I wouldn't really need to refer to any kind of documentation.
