

Installation of **jpt.jar** Version 2.5.0

For *eclipse* on Windows, **jpt.jar** should be placed in a folder whose name is **edu.neu.ccs** because this is the name of the main package in the Java Power Tools library. I choose the following specific folder:

C:\eclipse-jpt\edu.neu.ccs

You may of course choose whatever containing folder you wish. For me, the important point is to *keep jpt.jar out of the eclipse directory tree* so it is easy to delete that tree when upgrading to a new version of eclipse.

If you are using another development environment, then put **jpt.jar** in the **CLASSPATH** or in whatever location that environment uses to find its Java libraries.

The Java Power Tools library **jpt.jar** has been tested in a number of Java development environments and has worked in all environments attempted.

The **jpt.jar** library, version 2.5.0, was compiled using Java 1.4.2_11 so it is compatible with Java 1.4.2. This is useful when deploying applets for older browsers. The **jpt.jar** was also tested and works correctly with *eclipse* using Java 1.5.x.
