CS 3700 Networks and Distributed Systems

Lecture 2: Internet Architecture

Organizing Network Functionality

Organizing Network Functionality

- Networks are built from many components
 - Networking technologies
 - Ethernet, Wifi, Bluetooth, Fiber Optic, Cable Modem, DSL
 - Network styles
 - Circuit switch, packet switch
 - Wired, Wireless, Optical, Satellite
 - Applications
 - Email, Web (HTTP), FTP, BitTorrent, VolP
- How do we make all this stuff work together?!

Web

Email

Bittorrent

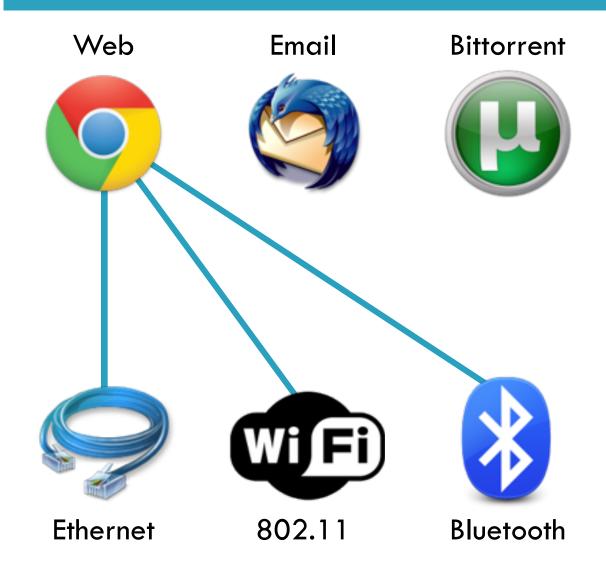

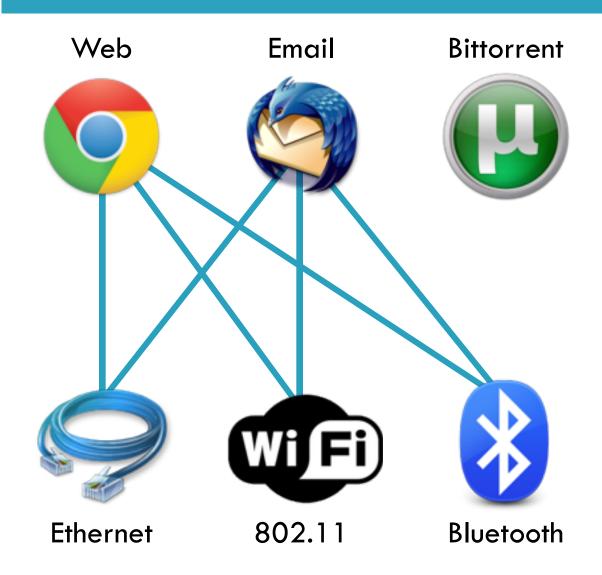

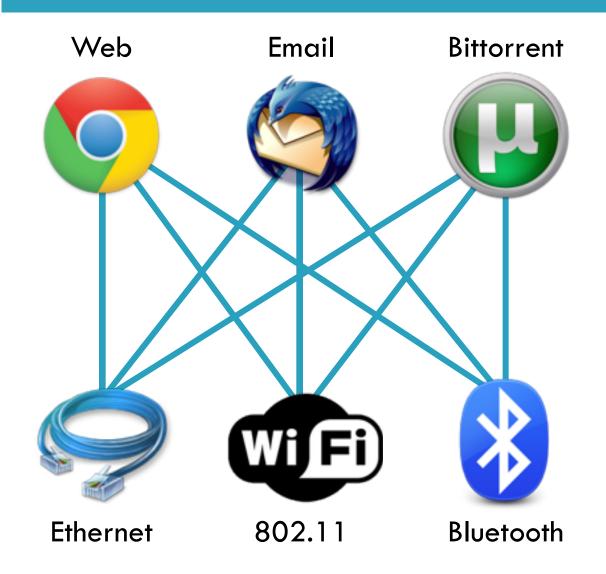

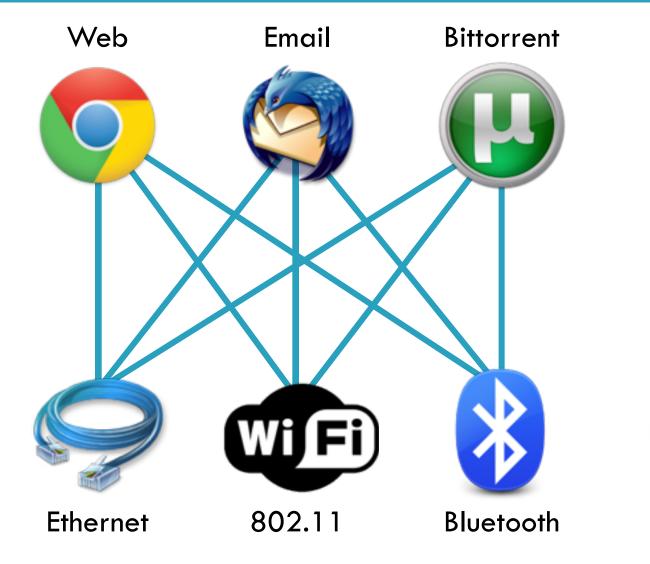

802.11

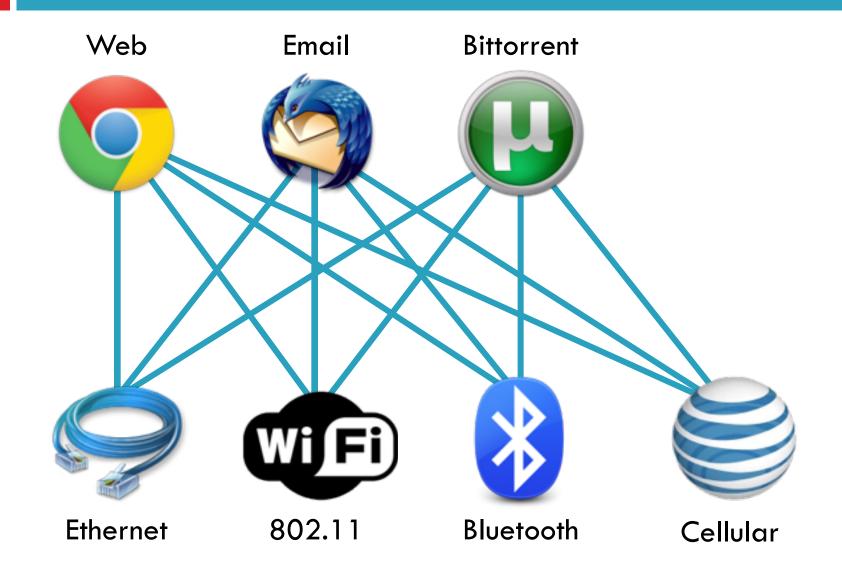

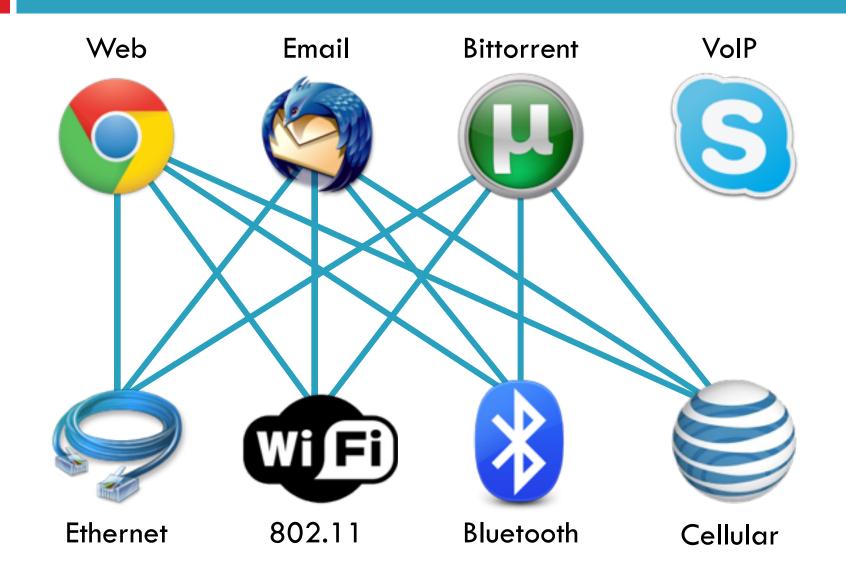

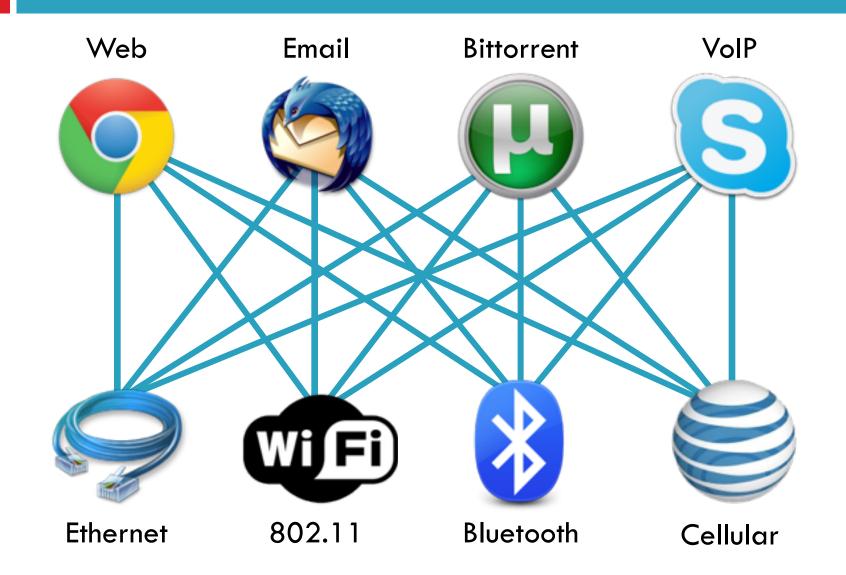

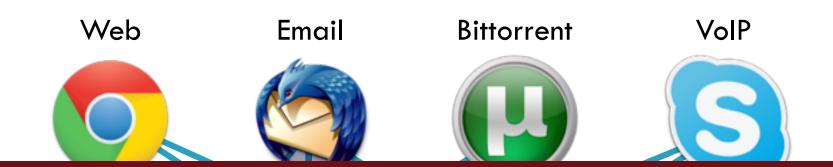

Cellular

- This is a nightmare scenario
- Huge amounts of work to add new apps or media
- Limits growth and adoption

802.11

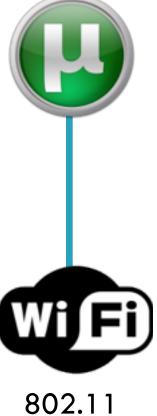

Bluetooth Cellular

More Problems

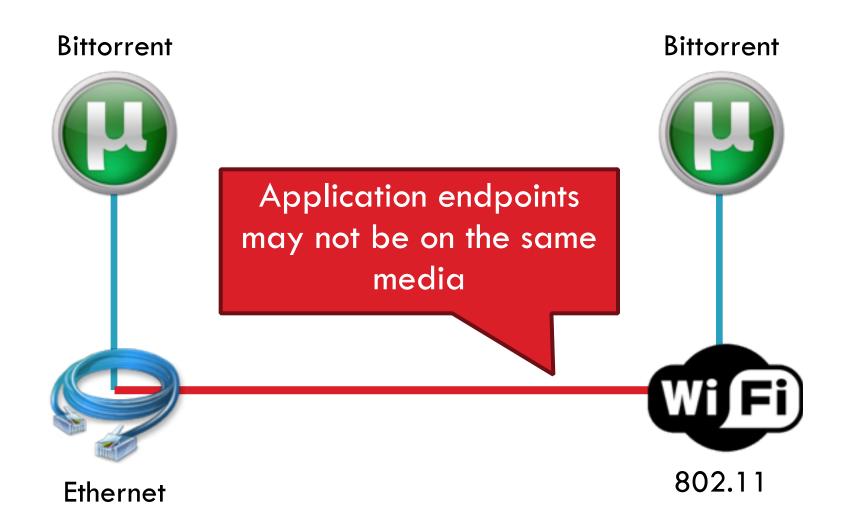

Bittorrent

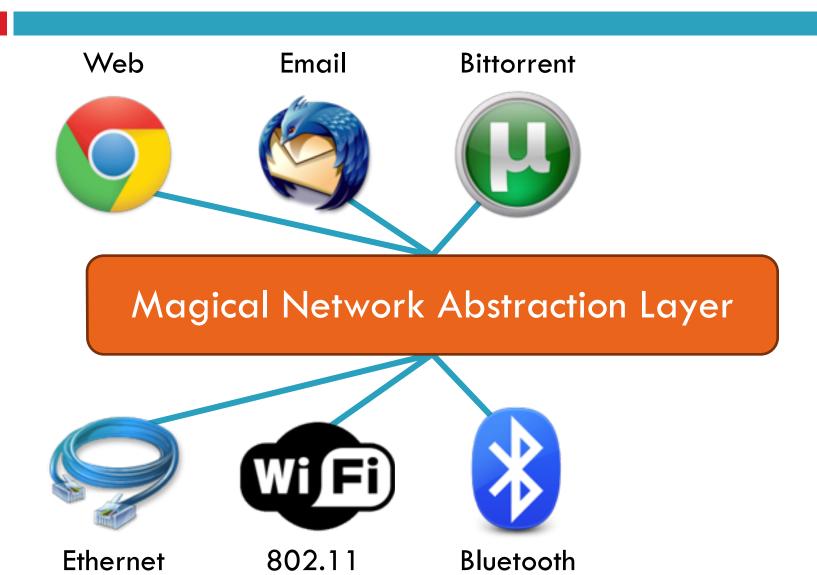

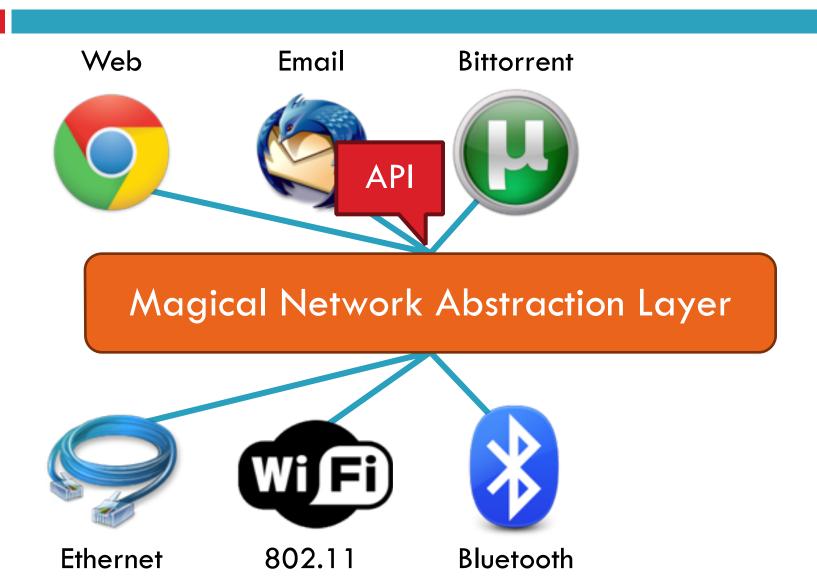

Bittorrent

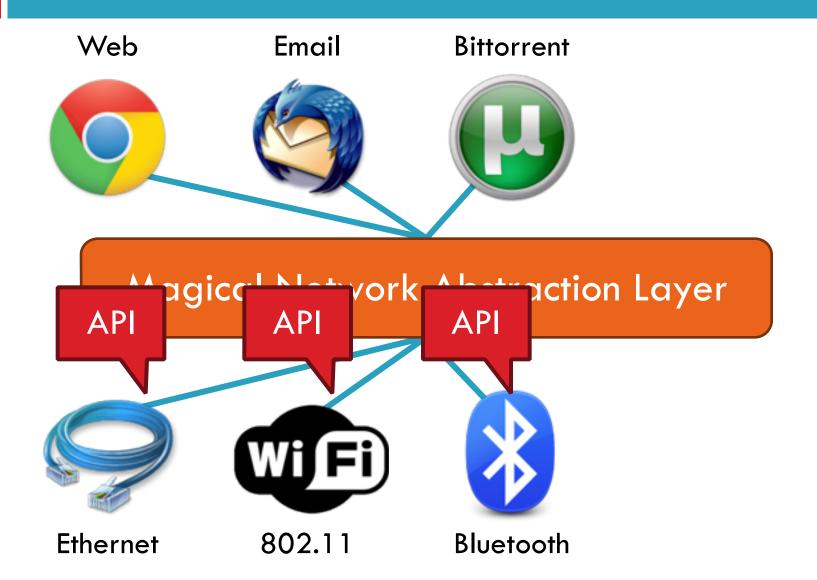

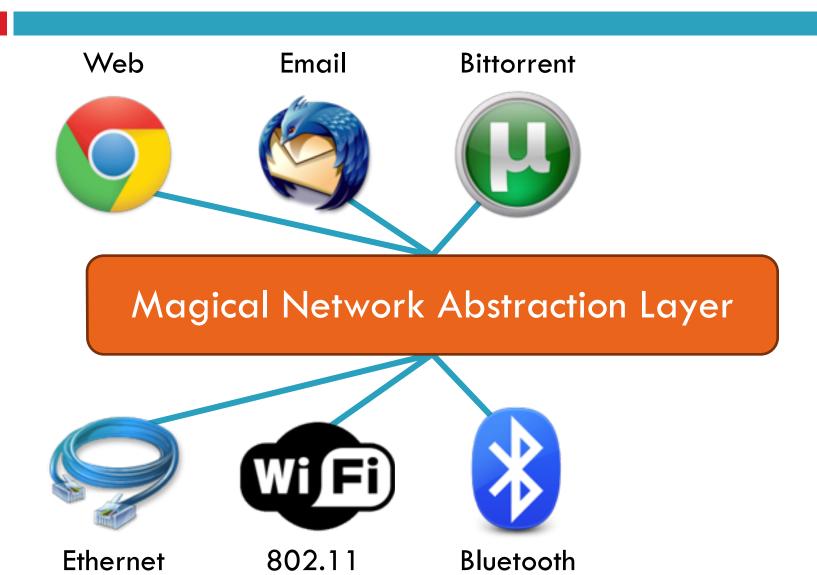

More Problems

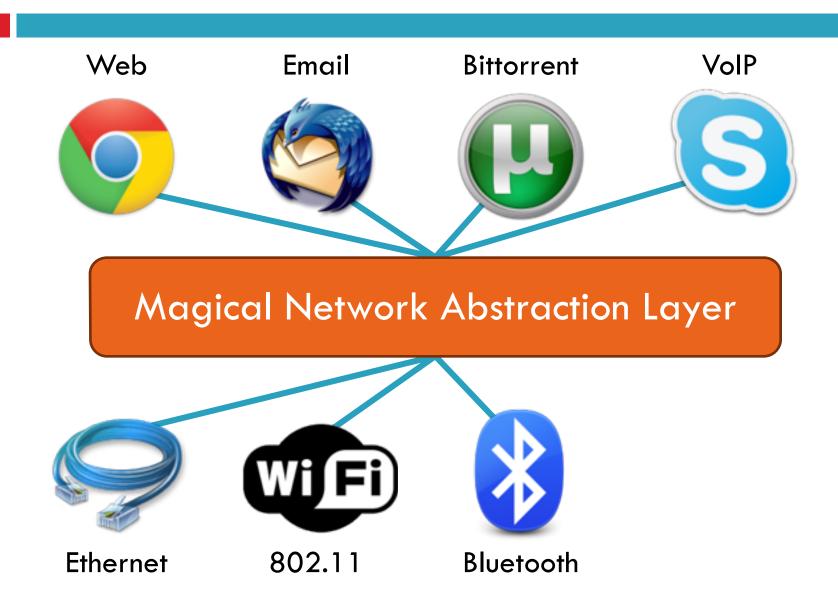

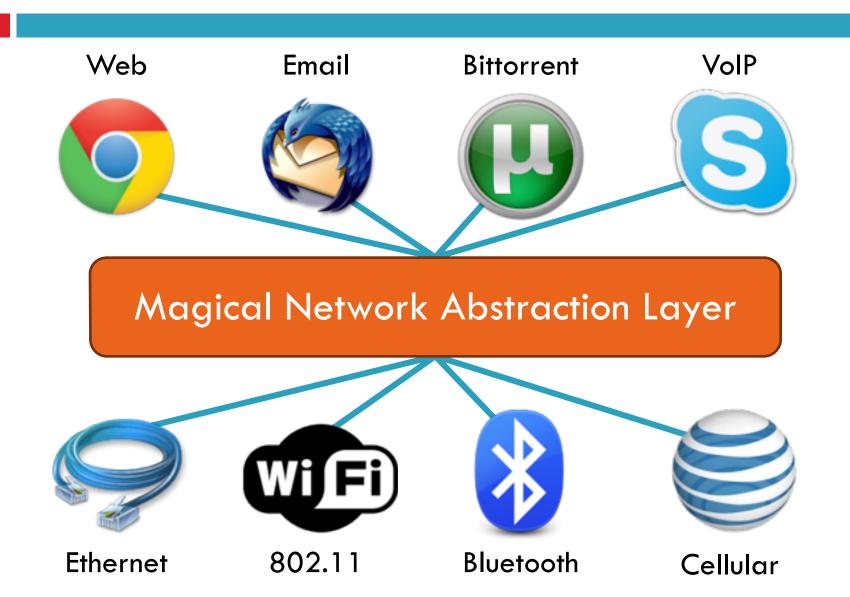

- O(1) work to add new apps, media
- Few limits on new technology

Applications

Layer N

Layer 2

Layer 1

- Modularity
 - Does not specify an implementation
 - Instead, tells us how to organize functionality

Applications

Layer N

- Modularity
 - Does not specify an implementation
 - Instead, tells us how to organize functionality
- Encapsulation
 - Interfaces define cross-layer interaction
 - Layers only rely on those below them

Layer 2

Layer 1

Applications

Layer N

Layer 2

Layer 1

- Modularity
 - Does not specify an implementation
 - Instead, tells us how to organize functionality
- Encapsulation
 - Interfaces define cross-layer interaction
 - Layers only rely on those below them
- **Flexibility**
 - Reuse of code across the network
 - Module implementations may change

Applications

Layer N

- Modularity
 - Does not specify an implementation
 - Instead, tells us how to organize functionality
- Encapsulation
 - Interfaces define cross-layer interaction
 - Layers only rely on those below them
- Flexibility
 - Reuse of code across the network
 - Module implementations may change
- Unfortunately, there are tradeoffs
 - Interfaces hide information
 - As we will see, may hurt performance...

Layer 2

Layer 1

- How do we divide functionality into layers?
 - Routing
 - Congestion control
 - Error checking

- Security
- Fairness
- And many more...

- How do we divide functionality into layers?
 - Routing

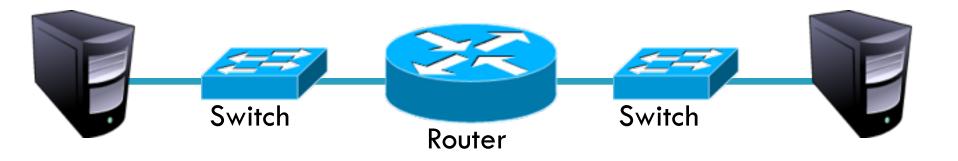

Security

Congestion control

Fairness

Error checking

- And many more...
- How do we distribute functionality across devices?
 - Example: who is responsible for security?

Layer Features

Application

Presentation

Session

Transport

Network

Data Link

- Service
 - What does this layer do?
- Interface
 - How do you access this layer?
- Protocol
 - How is this layer implemented?

Physical Layer

Application

Presentation

Session

Transport

Network

Data Link

- Service
 - Move information between two systems connected by a physical link
- Interface
 - Specifies how to send one bit
- Protocol
 - Encoding scheme for one bit
 - Voltage levels
 - Timing of signals
- Examples: coaxial cable, fiber optics, radio frequency transmitters

Data Link Layer

Application |

Presentation

Session

Transport

Network

Data Link

- Service
 - Data framing: boundaries between packets
 - Media access control (MAC)
 - Per-hop reliability and flow-control
- Interface
 - Send one packet between two hosts connected to the same media
- Protocol
 - Physical addressing (e.g. MAC address)
- Examples: Ethernet, Wifi, DOCSIS

Network Layer

Application

Presentation

Session

Transport

Network

Data Link

- Service
 - Deliver packets across the network
 - Handle fragmentation/reassembly
 - Packet scheduling
 - Buffer management
- Interface
 - Send one packet to a specific destination
- Protocol
 - Define globally unique addresses
 - Maintain routing tables
- Example: Internet Protocol (IP), IPv6

Transport Layer

Application

Presentation

Session

Transport

Network

Data Link

- Service
 - Multiplexing/demultiplexing
 - Congestion control
 - Reliable, in-order delivery
- Interface
 - Send message to a destination
- Protocol
 - Port numbers
 - Reliability/error correction
 - Flow-control information
- Examples: UDP, TCP

Session Layer

Application

Presentation

Session

Transport

Network

Data Link

- Service
 - Access management
 - Synchronization
- Interface
 - It depends...
- Protocol
 - Token management
 - Insert checkpoints
- Examples: none

Presentation Layer

Application

Presentation

Session

Transport

Network

Data Link

- Service
 - Convert data between different representations
 - E.g. big endian to little endian
 - E.g. Ascii to Unicode
- Interface
 - It depends...
- Protocol
 - Define data formats
 - Apply transformation rules
- Examples: none

Application Layer

Application

The layered abstraction is very nice

- The layered abstraction is very nice
- Does it hold in reality?

- The layered abstraction is very nice
- Does it hold in reality?

No.

- The layered abstraction is very nice
- Does it hold in reality?

No.

Firewalls

Analyze application layer headers

- The layered abstraction is very nice
- Does it hold in reality?

No.

Firewalls

Analyze application layer headers

Transparent Proxies

Simulate application endpoints within the network

- The layered abstraction is very nice
- Does it hold in reality?

No.

Firewalls

Analyze application layer headers

Transparent Proxies

Simulate application endpoints within the network

NATs

Break end-to-end network reachability

Outline

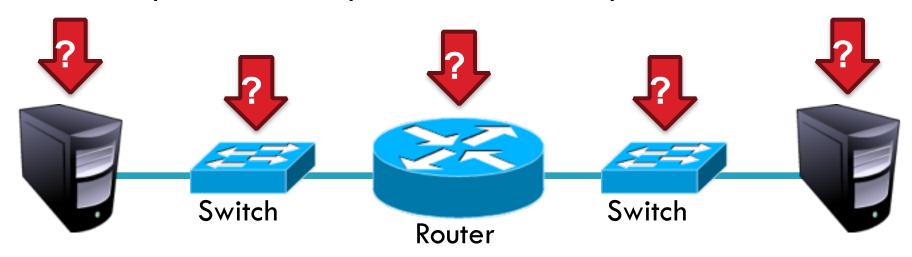

- Layering
 - The OSI Model
- Communicating
 - ☐ The End-to-End Argument

From Layers to Eating Cake

- IP gives us best-effort datagram forwarding
 - So simple anyone can do it
 - Large part of why the Internet has succeeded
 - ...but it sure isn't giving us much
- Layers give us a way to compose functionality
 - Example: HTTP over TCP for Web browsers with reliable connections
- ...but they do not tell us where (in the network) to implement the functionality

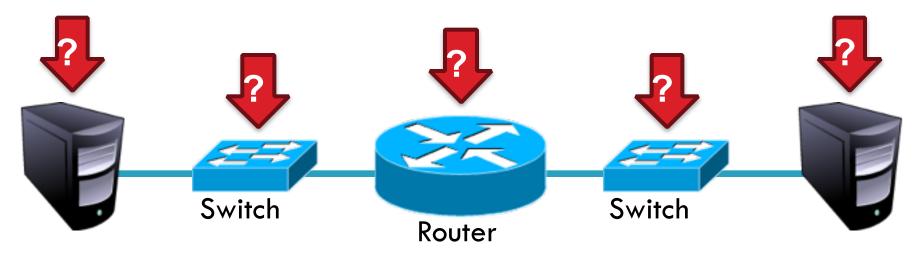

Where to Place Functionality

- How do we distribute functionality across devices?
 - Example: who is responsible for security?

Where to Place Functionality

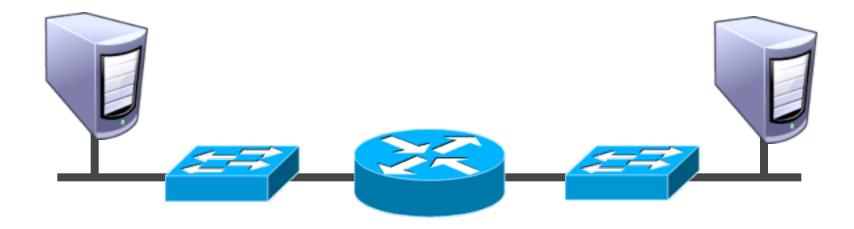

- How do we distribute functionality across devices?
 - Example: who is responsible for security?

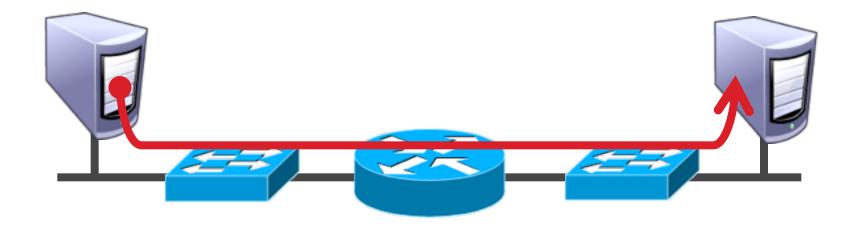

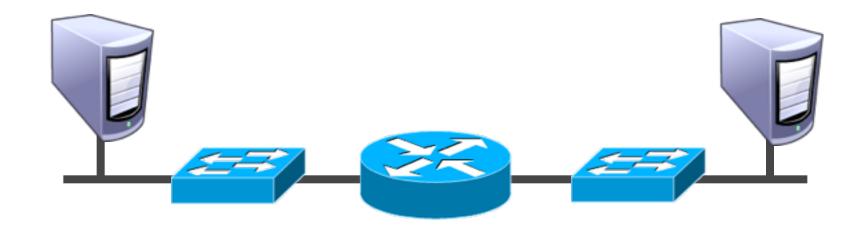

- "The End-to-End Arguments in System Design"
 - Saltzer, Reed, and Clark
 - The Sacred Text of the Internet
 - Endlessly debated by researchers and engineers

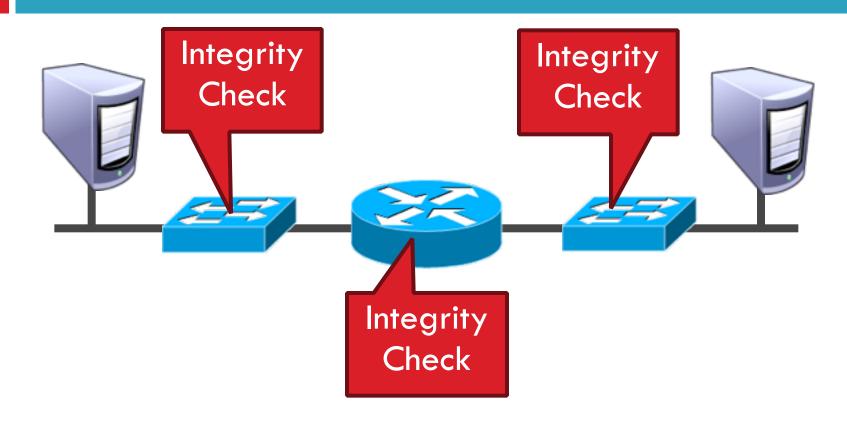

Basic Observation

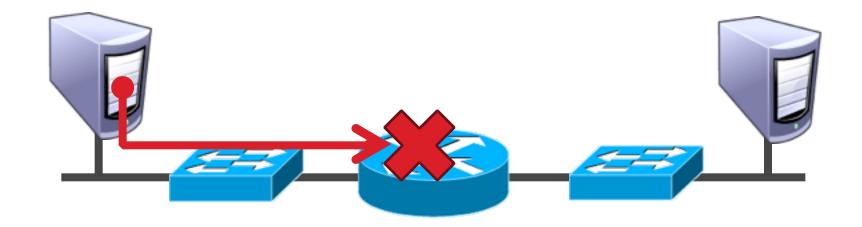

- Some applications have end-to-end requirements
 - Security, reliability, etc.
- Implementing this stuff inside the network is hard
 - Every step along the way must be fail-proof
 - Different applications have different needs
- End hosts...
 - Can't depend on the network
 - Can satisfy these requirements without network level support

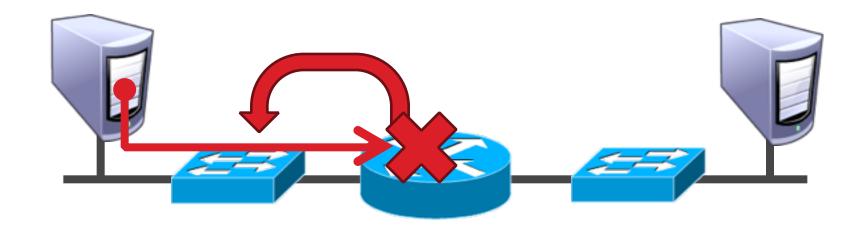

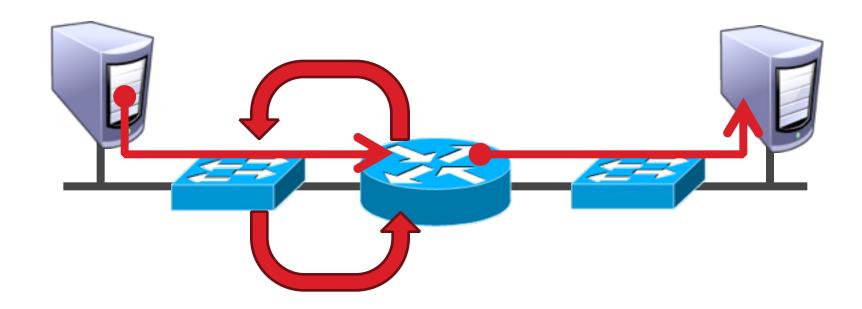

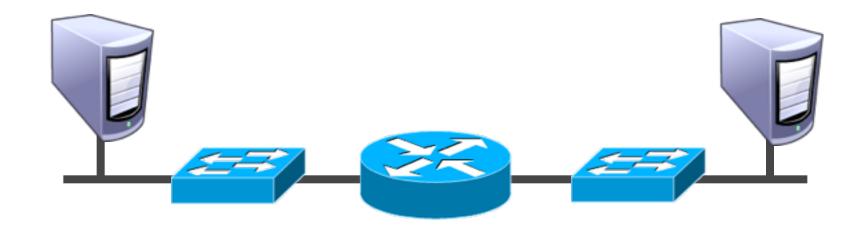

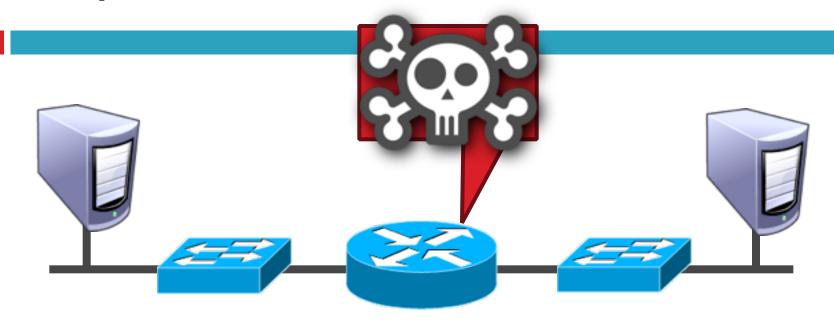

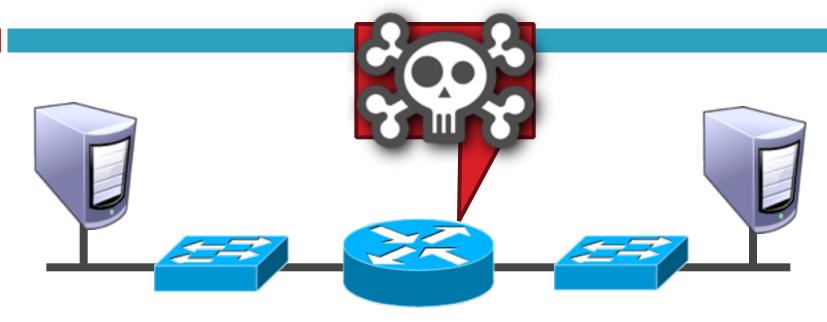

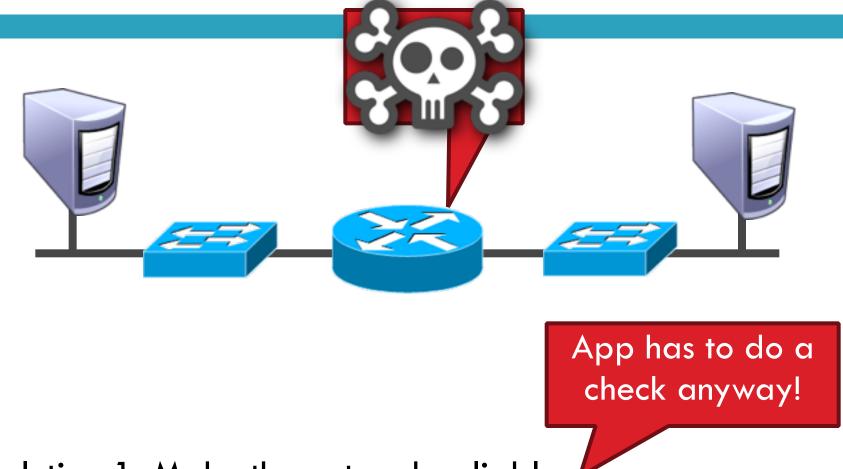

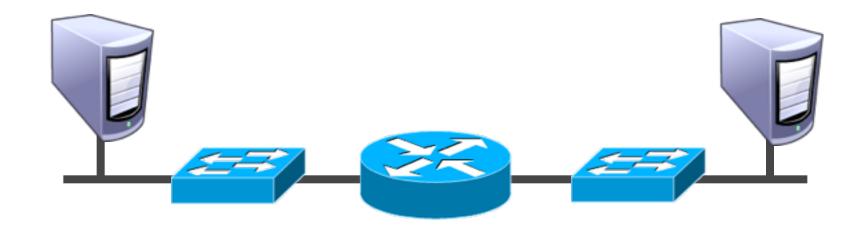

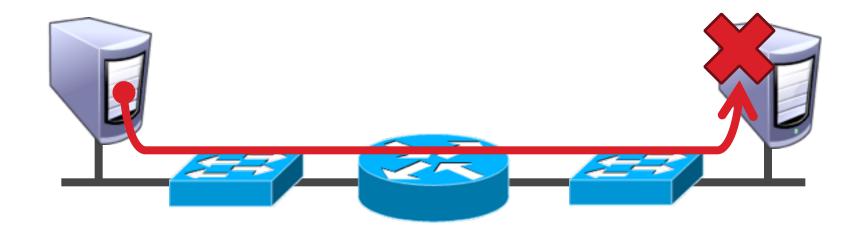

App has to do a check anyway!

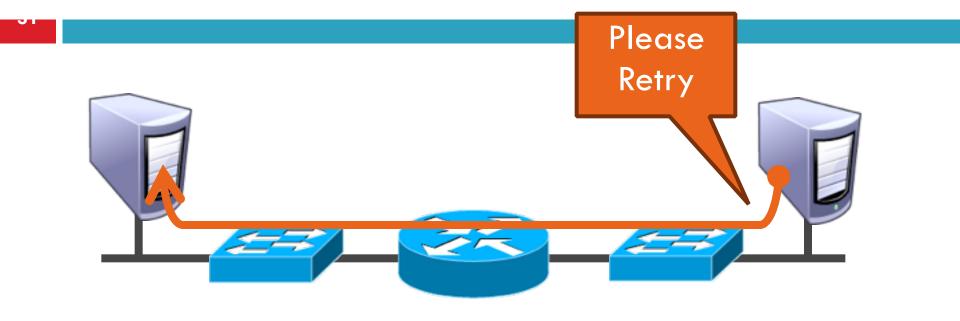

- Solution 1: Make the network reliable
- Solution 2: App level, end-to-end check, retry on failure

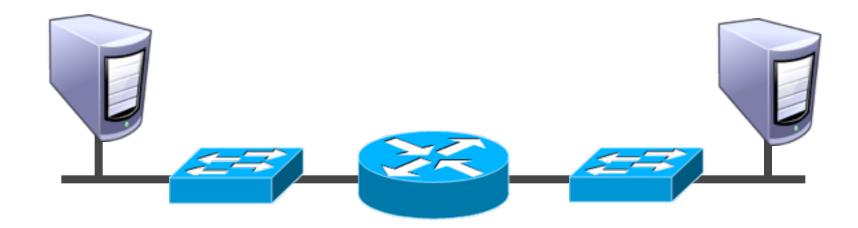

- Solution 1: Make the network reliable
- Solution 2: App level, end-to-end check, retry on failure

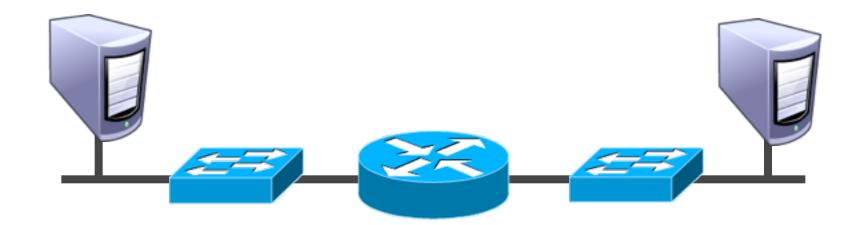

- Solution 1: Make the network reliable
- Solution 2: App level, end-to-end check, retry on failure

- Solution 1: Make the network reliable
- Solution 2: App level, end-to-end check, retry on failure

- Solution 1: Make the network reliable
- Solution 2: App level, end-to-end check, retry on failure

Full functionality can be built at App level

- Selution 1. Make the network reliable
- Solution 2: App level, end-to-end check, retry on failure

- In-network implementation...
 - > Doesn't reduce host complexity
 - Does increase network complexity
 - Increased overhead for apps that don't need functionality
- But, in-network performance may be better

- Solution 1: Make the network reliable
- Solution 2: App level, end-to-end check, retry on failure

Conservative Interpretation

Conservative Interpretation

"Don't implement a function at the lower levels of the system unless it can be completely implemented at this level" (Peterson and Davie)

Basically, unless you can completely remove the burden from end hosts, don't bother

Radical Interpretation

 Don't implement anything in the network that can be implemented correctly by the hosts

Radical Interpretation

 Don't implement anything in the network that can be implemented correctly by the hosts

Make network layer absolutely minimal

Ignore performance issues

Moderate Interpretation

Think twice before implementing functionality in the network

- If hosts can implement functionality correctly, implement it a lower layer only as a performance enhancement
- But do so only if it does not impose burden on applications that do not require that functionality...
- ...and if it doesn't cost too much \$ to implement

Reality Check, Again

Layering and E2E principals regularly violated

Firewalls

NATs

- Conflicting interests
 - Architectural purity
 - Commercial necessity

Takeaways

- Layering for network functions
 - Helps manage diversity in computer networks
 - Not optimal for everything, but simple and flexible
- Narrow waist ensures interoperability, enables innovation
- E2E argument (attempts) to keep IP layer simple
- Think carefully when adding functionality into the network
