

HW3: Sets

[HW instructions](#)

Problem 1 Computer Set Representation

Consider the bit string representation of sets A and B :

$A = \{\text{paul}, \text{george}\}$

$B = \{\text{ringo}, \text{george}\}$

U	john	paul	ringo	george
A	0	1	0	1
B	0	0	1	1
$A \cup B$				
$A \cap B$				
A^C				

For each of sets below:

- complete the empty row to the table which gives the bit string representation of the set
- tell which logical operator (AND, NOT, XOR, OR) of the bit string representations of A , B yield the same bit string representation of the set

i $A \cup B$

ii $A \cap B$

iii A^C

Problem 2 Set Builder

i Express the set:

$$S = \{n \in \mathbb{Z} \mid n \in \mathbb{N} \text{ and } (-11 \leq n) \text{ and } (n < 10)\}$$

by explicitly listing each item in a set (e.g. $\{1, 2, 3\}$). We assume that $0 \in \mathbb{N}$ above.

ii Express the set B of all integers whose square is either 25 or 36 using set builder notation.

iii Express the set B immediately above by listing.

Problem 3 Set Algebra

Simplify each of the following expressions by writing a sequence of equalities. Each equality should be labelled with the justifying algebraic law (see [logic_set_identities.pdf](#)). Please do not use multiple laws in a single step or use the set difference operator at all. U indicates the universal set which contains all elements.

i $((A^C \cap B) \cup (A^C \cap B^C))^C$

ii $(A^C \cap B^C)^C \cap U$

iii $(A \cup A) \cap (B \cup A^C)$

Problem 4 Venn Diagrams

Shade the indicated regions of the following Venn diagrams.

Problem 5 Set Operations

Consider the subsets $A = \{1, 2, 3, 6, 9\}$ and $B = \{3, 5\}$ of the universal set $U = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$. Express each of the following sets as an explicit list (e.g. $\{3, 5, 6\}$).

- i $\{2x + 1 \in U \mid x \in A\}$
- ii $\{x \in A \mid x \text{ is odd}\}$
- iii $\{x \in B \mid 2x \in U\}$
- iv $A \cap B$
- v $A \cup B$
- vi $A - B$
- vii $\overline{A \cap B}$
- viii $A \triangle B$

Problem 6 Set PIE, Indexing

A multiple of a number is the product of that number with a natural number (excluding zero). So, the multiples of 5 are $\{5, 10, 15, 20, 25, \dots\}$.

- i How many integers from 1 to 1000 are multiples of 7?
- ii How many integers from 1 to 1000 are multiples of 11?
- iii How many integers from 1 to 1000 are multiples of 7 and 11?¹
- iv How many integers from 1 to 1000 are multiples of 7 or 11?
- v How many integers from 1 to 1000 are multiples of 7 but not 11?
- vi How many integers from 1 to 1000 are multiples of neither 7 nor 11?

Problem 7 ★ Set PIE, Indexing 2 [optional, no credit]

How many integers from 1 to 1000 are multiples of 6 or 15, but not of 10?

¹Hint: the smallest positive value which is a multiple of both 7 and 11 is 77
